

- Ideal for 418.0 MHz Transmitters
- Very Low Series Resistance
- Quartz Stability
- Surface-Mount, Ceramic Case with 21 mm<sup>2</sup> Footprint • Complies with Directive 2002/95/EC (RoHS)

The RO3103D is a true one-port, surface-acoustic-wave (SAW) resonator in a surface-mount, ceramic case. It provides reliable, fundamental-mode, quartz frequency stabilization of fixed-frequency transmitters operating at 418.0 MHz. This SAW is designed specifically for AM transmitters in wireless security and remote control applications operating in the USA under FCC Part 15, in Australia, in Japan, and in Korea.

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling.

Notes:

- Frequency aging is the change in f<sub>C</sub> with time and is specified at +65°C or 1. less. Aging may exceed the specification for prolonged temperatures above +65°C. Typically, aging is greatest the first year after manufacture, decreasing in subsequent years.
- The center frequency,  $f_{\text{C}},$  is measured at the minimum insertion loss point, 2 IL<sub>MIN</sub>, with the resonator in the 50  $\Omega$  test system (VSWR  $\leq$  1.2:1). The shunt inductance,  $L_{TEST}$ , is tuned for parallel resonance with  $C_0$  at  $f_c$ . Typically, fOSCILLATOR or fTRANSMITTER is approximately equal to the resonator f<sub>C</sub>.
- One or more of the following United States patents apply: 4,454,488 and 3. 4.616.197.
- Typically, equipment utilizing this device requires emissions testing and 4 government approval, which is the responsibility of the equipment manufacturer.
- 5 Unless noted otherwise, case temperature  $T_C = +25^{\circ}C \pm 2^{\circ}C$ .
- The design, manufacturing process, and specifications of this device are 6.

subject to change.

Subject to change. Derived mathematically from one or more of the following directly measured parameters:  $f_C$ , IL, 3 dB bandwidth,  $f_C$  versus  $T_C$ , and  $C_O$ . Turnover temperature,  $T_O$ , is the temperature of maximum (or turnover) 7.

- 8. frequency, f<sub>O</sub>. The nominal frequency at any case temperature, T<sub>C</sub>, may be calculated from:  $f = f_0 [1 - FTC (T_0 - T_C)^2]$ . Typically oscillator  $T_0$  is approximately equal to the specified resonator To.
- 9. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance Co is the static (nonmotional) capacitance between the two terminals measured at low frequency (10 MHz) with a capacitance meter. The measurement includes parasitic capacitance with "NC" pads unconnected. Case parasitic capacitance is approximately 0.05 pF. Transducer parallel capacitance can by calculated as:  $C_P \approx C_0 - 0.05$  pF.
- Tape and Reel Standard Per ANSI / EIA 481. 10.

#### **Electrical Connections**

The SAW resonator is bidirectional and may be installed with either orientation. The two terminals are interchangeable and unnumbered. The callout NC indicates no internal connection. The NC pads assist with mechanical positioning and stability. External grounding of the NC pads is recommended to help reduce parasitic capacitance in the circuit.
