Features

- **Industry-standard Architecture**
  - **Low-cost, Easy-to-use Software Tools**
- **High-speed, Electrically Erasable Programmable Logic Devices**
  - **5ns Maximum Pin-to-pin Delay**
- **Latch Feature Holds Inputs to Previous Logic States**
- **Pin-controlled Standby Power (10µA Typical)**
- **Advanced Flash Technology**
  - **Reprogrammable**
  - **100% Tested**
- **High-reliability CMOS Process**
  - **20-year Data Retention**
  - **100 Erase/Write Cycles**
  - **2,000V ESD Protection**
  - **200mA Latch-up Immunity**
- **Dual Inline and Surface Mount Packages in Standard Pinouts**
- **PCI-compliant**
- **Green Package Options (Pb/Halide-free/RoHS Compliant) Available**
- **Full Military, Commercial and Industrial Temperature Ranges**
- **Backward-Compatible with Atmel ATF22V10B(Q) and Atmel AT22V10(L)**
- **Applications Include Glue Logic for 5.0V Systems, DMA Control, State Machine Control, Graphics Processing**

High-performance Electrically Erasable Programmable Logic Device

Atmel ATF22V10C
Atmel ATF22V10CQ

See separate datasheet for the Atmel ATF22V10C(Q)Z

1. Description

The Atmel® ATF22V10C is a high-performance CMOS (electrically erasable) programmable logic device (PLD) that utilizes proven electrically erasable Flash memory technology from Atmel. Speeds down to 5ns and power dissipation as low as 10µA (typical) are offered. All speed ranges are specified over the full 5V ± 10% range for military and industrial temperature ranges, and 5V ± 5% for commercial temperature ranges.

Several low-power options allow selection of the best solution for various types of power-limited applications. Each of these options significantly reduces total system power and enhances system reliability.
Figure 1-1. Logic Diagram

2. Pin Configurations

Table 2-1. Pin Configurations (All Pinouts Top View)

| Pin Name	Function
CLK	Clock
IN	Logic Inputs
I/O	Bi-directional Buffers
GND	Ground
VCC	+5V Supply
PD	Power-down

**Figure 2-1.** TSSOP

Figure 2-2. DIP/SOIC

Figure 2-3. PLCC/LCC

Note: For all PLCCs (except "-5"), pins 1, 8, 15 and 22 can be left unconnected. However, if they are connected, superior performance will be achieved

3. Absolute Maximum Ratings*

Temperature under Bias .... -55°C to +125°C

Storage Temperature...................... -65°C to +150°C

Voltage on Any Pin with
Respect to Ground...........................-2.0V to +7.0V[1]

Voltage on Input Pins
with Respect to Ground
during Programming ....-2.0V to +14.0V[1]

Programming Voltage with
Respect to Ground.........................-2.0V to +14.0V[1]

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20ns.
Maximum output pin voltage is V_{CC} + 0.75V DC, which may overshoot to 7.0V for pulses of less than 20ns.

4. DC and AC Operating Conditions

|	Commercial	Industrial	Military
Operating Temperature (Ambient)	0°C - 70°C	-40°C - 85°C	-55°C - 125°C (case)
V_{CC} Power Supply	5V ± 5%	5V ± 10%	5V ± 10%

4.1 DC Characteristics

Symbol	Parameter	Condition			Min	Typ	Max	Units
I_{IL}	Input or I/O Low Leakage Current	$0 \leq V_{IN} \leq V_{IL}$ (Max)					-10.0	µA
I_{IH}	Input or I/O High Leakage Current	$3.5 \leq V_{IN} \leq V_{CC}$					10.0	µA
I_{CC}	Power Supply Current, Standby	V_{CC} = Max, V_{IN} = Max, Outputs Open	C-5, 7, 10	Com.		85.0	130.0	mA
			C-10	Ind.		90.0	140.0	mA
			C-15	Ind.		65.0	115.0	mA
			CQ-15	Ind.		35.0	70.0	mA
I_{CC2}	Clocked Power Supply Current	V_{CC} = Max, Outputs Open, f = 15MHz	C-5, 7, 10	Com.			150.0	mA
			C-10	Ind., Mil.			160.0	mA
			C-15	Ind.		70.0	125	mA
			C-15	Mil.			160.0	mA
			CQ-15	Ind.		40.0	80.0	mA
I_{PD}	Power Supply Current, PD Mode	V_{CC} = Max	Com.			10.0	500.0	µA
		V_{IN} = 0, Max	Ind.			10.0	650.0	µA
I_{OS}[1]	Output Short Circuit Current	V_{OUT} = 0.5V					-130.0	mA
V_{IL}	Input Low Voltage				-0.5		0.8	V
V_{IH}	Input High Voltage				2.0		V_{CC}+0.75	V
V_{OL}	Output Low Voltage	$V_{IN} = V_{IH}$ or V_{IL}, V_{CC} = Min	I_{OL} = 16mA	Com., Ind.			0.5	V
			I_{OL} = 12mA	Mil.			0.5	V
V_{OH}	Output High Voltage	$V_{IN} = V_{IH}$ or V_{IL}, V_{CC} = Min	I_{OH} = -4.0mA		2.4			V

Note: 1. Not more than one output at a time should be shorted. Duration of short circuit test should not exceed 30 sec

4.2 AC Waveforms [1]
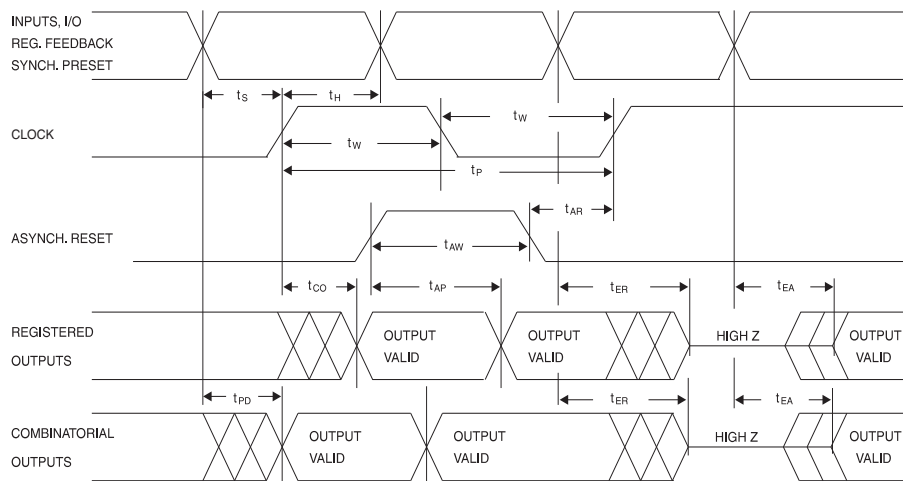

Note: 1. Timing measurement reference is 1.5V. Input AC driving levels are 0.0V and 3.0V, unless otherwise specified

4.3 AC Characteristics[1]

Symbol	Parameter	-5 Min	-5 Max	-7 Min	-7 Max	-10 Min	-10 Max	-15 Min	-15 Max	Units

t_{DLOV}	PD Low to Valid Output		20.0		25.0		30.0		35.0	ns

Notes: 1. Output data is latched and held

2. High-Z outputs remain high-Z

3. Clock and input transitions are ignored

4.5 Input Test Waveforms

4.5.1 Input Test Waveforms and Measurement Levels
4.5.2 Commercial Output Test Loads
4.6 Pin Capacitance

Table 4-1. Pin Capacitance (f = 1MHz, T = 25°C[1])

	Typ	Max	Units	Conditions
C_{IN}	5	8	pF	V_{IN} = 0V
C_{OUT}	6	8	pF	V_{OUT} = 0V

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested

4.7 Power-up Reset

The registers in the Atmel® ATF22V10Cs are designed to reset during power-up. At a point delayed slightly from V_{CC} crossing V_{RST}, all registers will be reset to the low state. The output state will depend on the polarity of the output buffer.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how V_{CC} actually rises in the system, the following conditions are required:

1. The V_{CC} rise must be monotonic, and starts below 0.7V
2. After reset occurs, all input and feedback setup times must be met before driving the clock pin high
3. The clock must remain stable during t_{PR}

Figure 4-1. Power-up Reset Timing
4.8 Preload of Registered Outputs

The ATF22V10C registers are provided with circuitry to allow loading of each register with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A JEDEC file with preload is generated when a source file with vectors is compiled. Once downloaded, the JEDEC file preload sequence will be done automatically by most of the approved programmers after the programming.

5. Electronic Signature Word

There are 64-bits of programmable memory that are always available to the user, even if the device is secured. These bits can be used for user-specific data.

6. Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF22V10C fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64-bit User Signature remains accessible.

The security fuse should be programmed last, as its effect is immediate.

7. Programming/Erasing

Programming/erasing is performed using standard PLD programmers. See "CMOS PLD Programming Hardware and Software Support" for information on software/programming.

Table 7-1. Programming/Erasing

Parameter	Description	Typ	Max	Units
t_{PR}	Power-up Reset Time	600	1,000	ns
V_{RST}	Power-up Reset Voltage	3.8	4.5	V

8. Input and I/O Pin-keeper Circuits

The Atmel® ATF22V10C contains internal input and I/O pin-keeper circuits. These circuits allow each ATF22V10C pin to hold its previous value even when it is not being driven by an external source or by the device's output buffer. This helps to ensure that all logic array inputs are at known valid logic levels. This reduces system power by preventing pins from floating to indeterminate levels. By using pin-keeper circuits rather than pull-up resistors, there is no DC current required to hold the pins in either logic state (high or low).

These pin-keeper circuits are implemented as weak feedback inverters, as shown in the Input Diagram below. These keeper circuits can easily be overdriven by standard TTL- or CMOS-compatible drivers. The typical overdrive current required is 40µA.

Figure 8-1. Input Diagram
Figure 8-2. I/O Diagram
9. Power-down Mode

The Atmel® ATF22V10C includes an optional pin-controlled power-down feature. When this mode is enabled, the PD pin acts as the power-down pin (Pin 4 on the DIP/SOIC packages and Pin 5 on the PLCC package). When the PD pin is high, the device supply current is reduced to less than 100mA. During power-down, all output data and internal logic states are latched and held. Therefore, all registered and combinatorial output data remain valid. Any outputs that were in an undetermined state at the onset of power-down will remain at the same state. During power-down, all input signals except the power-down pin are blocked. Input and I/O hold latches remain active to ensure that pins do not float to indeterminate levels, further reducing system power. The power-down pin feature is enabled in the logic design file. Designs using the power-down pin may not use the PD pin logic array input. However, all other PD pin macrocell resources may still be used, including the buried feedback and foldback product term array inputs.

PD pin configuration is controlled by the design file, and appears as a separate fuse bit in the JEDEC file. When the power-down feature is not specified in the design file, the IN/PD pin will be configured as a regular logic input.

Note: Some programmers list the 22V10 JEDEC compatible 22V10C (no PD used) separately from the non-22V10 JEDEC compatible 22V10CEX (with PD used)

10. Compiler Mode Selection

Table 10-1. Compiler Mode Selection

	PAL Mode (5828 Fuses)	GAL Mode (5892 Fuses)	Power-down Mode[1] (5893 Fuses)
Synario	ATF22V10C (DIP) ATF22V10C (PLCC)	ATTF22V10C DIP (UES) ATF22C10C PLCC (UES)	ATF22V10C DIP (PWD) ATF22V10C PLCC (PWD)
WINCUPL	P22V10 P22V10LCC	G22V10 G22V10LCC	G22V10CP G22V10CPLCC

Note: 1. These device types will create a JEDEC file which when programmed in Atmel ATF22V10C devices will enable the power-down mode feature. All other device types have the feature disabled
