

ACT512 Rev 4, 13-Feb-14

ActiveQR[™] Quasi-Resonant PWM Controller

FEATURES

- CCM and Quasi-Resonant Operation
- Adjustable up to 75kHz Switching Frequency
- OCP/OLP Protection
- Integrated Patented Frequency Foldback Technique
- Integrated Patented Line Compensation
- Built-in Soft-Start Circuit
- Line Under-Voltage, Thermal, Output Overvoltage, Output Short Protections
- Current Sense Resistor Short Protection
- Transformer Winding Short Protection
- 100mW Standby Power
- Complies with Global Energy Efficiency and CEC Average Efficiency Standards
- Tiny SOT23-6 Packages

APPLICATIONS

- AC/DC Adaptors/Chargers for Cell Phones, Cordless Phone, PDAs, E-books
- Adaptors for Portable Media Player, DSCs, Set-top boxes, DVD players, records
- Linear Adapter Replacements

GENERAL DESCRIPTION

The ACT512 is a high performance peak current mode PWM controller. ACT512 applies *ActiveQR*TM and frequency foldback technique to reduce EMI and improve efficiency. ACT512's maximum design switching frequency is set at 75kHz. Very low standby power, good dynamic response and accurate voltage regulation is achieved with an opto-coupler and the secondary side control circuit.

The idle mode operation enables low standby power of 100mW with small output voltage ripple. By applying frequency foldback and $ActiveQR^{TM}$ technology, ACT512 increases the average system efficiency compared to conventional solutions and exceeds the latest ES2.0 efficiency standard with good margin.

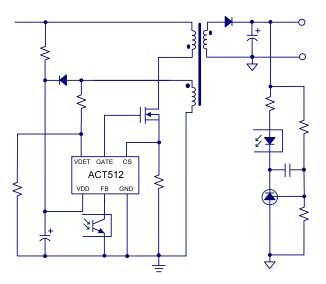

ACT512 integrates comprehensive protection. In case of over temperature, over voltage, winding short, current sense resistor short, open loop and overload conditions, it would enter into auto restart mode including Cycle-by-Cycle current limiting.

ACT512 is to achieve no overshoot and very short rise time even with a big capacitive load with the built-in fast and soft start process.

In full load condition, ACT512 is able to be designed to work in both CCM mode and DCM mode to meet different types of applications. Quasi-Resonant (QR) operation mode can improve efficiency during DCM operation, and reduce EMI and further reduce the components in input filter.

ACT512 is ideal for applications up to 60 Watts.

ORDERING INFORMATION

| PART NUMBER | TEMPERATURE RANGE | PACKAGE | PINS | PACKING METHOD | TOP MARK |
|-------------|-------------------|---------|------|-------------------|----------|
| ACT512US-T | -40°C to 85°C | SOT23-6 | 6 | TUBE & REEL | FSHT |

PIN CONFIGURATION

SOT23-6 ACT512US

PIN DESCRIPTIONS

| PIN | NAME | DESCRIPTION |
|-----|------|---|
| 1 | CS | Current Sense Pin. Connect an external resistor (R_{CS}) between this pin and ground to set peak current limit for the primary switch. |
| 2 | GND | Ground. |
| 3 | GATE | Gate Drive. Gate driver for the external MOSFET transistor. |
| 4 | VDD | Power Supply. This pin provides bias power for the IC during startup and steady state operation. |
| 5 | VDET | Valley Detector Pin. Connect this pin to a resistor divider network from the auxiliary winding to detect zero-crossing points for valley turn on operation. |
| 6 | FB | Feedback Pin. Connect this pin to optocouplers's collector for output regulation. |

ABSOLUTE MAXIMUM RATINGS[®]

| PARAMETER | VALUE | UNIT |
|--|--------------|------|
| FB, CS, VDET to GND | -0.3 to + 6 | V |
| VDD, GATE to GND | -0.3 to + 28 | V |
| Maximum Power Dissipation (SOT23-6) | 0.45 | W |
| Operating Junction Temperature | -40 to 150 | °C |
| Junction to Ambient Thermal Resistance (θ_{JA}) | 220 | °C/W |
| Storage Temperature | -55 to 150 | °C |
| Lead Temperature (Soldering, 10 sec) | 300 | °C |

①: Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods.

FUNCTIONAL BLOCK DIAGRAM

FUNCTIONAL DESCRIPTION

ACT512 is a high performance peak current mode low-voltage PWM controller IC. The controller includes the most advance features that are required in the adaptor applications up to 60 Watt. Unique fast startup, frequency foldback, QR switching technique, accurate peak current line compensation, idle mode, short winding protection, OCP, OTP, OVP and UVLO are included in the controller.

Startup

Startup current of ACT512 is designed to be very low so that VDD could be charged to V_{DDON} threshold level and device starts up quickly. A large value startup resistor can therefore be used to minimize the power loss yet reliable startup in application. For a typical AC/DC adaptor with universal input range design, two 1M Ω , 1/8 W startup resistors could be used together with a VDD capacitor(4.7uF) to provide a fast startup and yet low power dissipation design solution.

During startup period, the IC begins to operate with minimum Ippk to minimize the switching stresses for the main switch, output diode and transformers. And then, the IC operates at maximum power output to achieve fast rise time. After this, V_{OUT} reaches about 90% V_{OUT} , the IC operates with a 'soft-landing' mode(decrease Ippk) to avoid output overshoot.

Constant Voltage (CV) Mode Operation

In constant voltage operation, the ACT512 regulates its output voltage through secondary side control circuit. The output voltage information is sensed at FB pin through OPTO coupling. The error signal at FB pin is amplified through TL431 and OPTO circuit. When the secondary output voltage is above regulation, the error amplifier output voltage decreases to reduce the switch current. When the secondary output voltage increases to ramp up the switch current to bring the secondary output back to regulation. The output regulation voltage is determined by the following relationship:

$$V_{OUTCV} = V_{REF_{-}TL431} \times (1 + \frac{R_{F1}}{R_{F2}})$$
 (1)

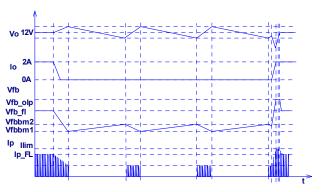

where R_{F1} (R15) and R_{F2} (R16) are top and bottom feedback resistor of the TL431.

No Load Idle Mode

In no load standby mode, the feedback voltage falls below V_{FBBM2} and reaches $V_{\text{FBBM1}}, \ ACT512$ stop

switching. After it stops, as a result of a feedback reaction, the feedback voltage increases. When the feedback voltage reaches V_{FBBM2} , ACT512 start switching again. Feedback voltage drops again and output voltage starts to bounds back and forward with very small output ripple. ACT512 leaves idle mode when load is added strong enough to pull feedback voltage exceed V_{FBBM2} .

Primary Inductor Current Limit Compensation

The ACT512 integrates a primary inductor peak current limit compensation circuit to achieve constant OLP over wide line and wide inductance.

Frequency Foldback

When the load drops to 75% of full load level, ACT512 starts to reduce the switching frequency, which is proportional to the load current ,to improve the efficiency of the converter.

ACT512's load adaptive switching frequency enables applications to meet all latest green energy standards. The actual minimum average switching frequency is programmable with output capacitance, feedback circuit and dummy load (while still meeting standby power).

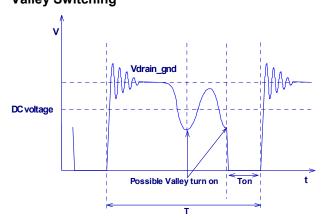

Valley Switching

ACT512 employed valley switching from no load to heavy load to reduce switching loss and EMI. In discontinuous mode operation, the resonant voltage between inductance and parasitic capacitance on MOSFET source pin is coupled by auxiliary winding and reflected on VDET pin through feedback network R5, R6. Internally, the VDET pin is connected to an zero-crossing detector to generate the switch turn on signal when the conditions are met.

FUNCTIONAL DESCRIPTION CONT'D

Figure 3: Valley Switching

Protection Features

The ACT512 provides full protection functions. The following table summarizes all protection functions.

Auto-Restart Operation

ACT512 will enter into auto-restart mode when a fault is identified. There is a startup phase in the auto-restart mode. After this startup phase the conditions are checked whether the failure is still present. Normal operation proceeds once the failure mode is removed. Otherwise, new startup phase will be initiated again.

To reduce the power loss during fault mode, the startup delay control is implemented. The startup delay time increases over lines.

| PROTECTION FUNCTIONS | FAILURE CONDITION | PROTECTION MODE |
|--|--|--------------------|
| V _{DD} Over Voltage | V _{DD} > 25V (4 duty cycle) | Auto Restart |
| V _{VDET} Over Volt- age/No Voltage | V _{VD} > 2.72V or No switching for 4 cycles | Auto Restart |
| Over Temperature | T > 135°C | Auto Restart |
| Short Winding/ Short Diode | V _{CS} > 1.72V | Auto Restart |
| Over Load/Open Loop | $IPK = I_{LIMIT} \text{ or} \\ V_{FB} = 3.5V + V_{BE} \\ \text{for 320ms}$ | Auto Restart |
| Output Short Circuit | V _{DET} < 0.58V | Auto Restart |
| V _{DD} Under Volt- age | V _{DD} < 7.4V | Auto Restart |

TYPICAL APPLICATION

Design Example

The design example below gives the procedure for 12V/2A flyback converter using ACT512. Refer to application circuit Figure 4, the design for an adapter application starts with the following specification:

| Input Voltage Range | 90VAC - 265VAC, 50/60Hz |
|----------------------------------|-------------------------|
| Output Power, Po | 24W |
| Output Voltage, VOUTCV | 12V |
| Full Load Current, IOUTFL | 2A |
| OCP Current, I _{OUTMAX} | 2.3-2.6A |
| System Efficiency CV, η | 0.86 |

The operation for the circuit shown in Figure 4 is as follows: the rectifier bridge D1-D4 and the capacitor C1/C2 convert the AC line voltage to DC bus voltage. This voltage supplies the primary winding of the transformer T1 and the startup circuit of R7/ R8 and C4 to VDD pin of ACT512. The primary power current path is formed by the transformer's primary winding, Q1, and the current sense resistor R9. The resistors R3, R2, diode D5 and capacitor C3 create a snubber clamping network that protects Q1 from damage due to high voltage spike during Q1's turn off. The network consisting of capacitor C4, diode D6 and resistor R4 provides a VDD supply voltage for ACT512 from the auxiliary winding of the transformer. The resistor R4 is optional, which filters out spikes and noise to makes VDD more stable. C4 is the decoupling capacitor of the supply voltage and energy storage component for startup. During power startup, the current charges C4 through startup resistor R7/R8 from the voltage. The diode D8 and the rectified bus capacitor C5/L2/C6 rectify filter the output voltage. The resistor divider consists of R15 and R16 programs the output voltage. Since a bridge rectifier and bulk input capacitors are used, the resulting minimum and maximum DC input voltages can be calculated:

$$V_{INDC _MIN} = \sqrt{2V_{INAC _MIN}^{2}} \frac{2P_{OUT}(\frac{1}{2f_{L}} - t_{C})}{\eta \times C_{IN}}$$

$$= \sqrt{2 \times 90^{2} - \frac{2 \times 24 \times (\frac{1}{2 \times 47} - 3.5 \,\text{ms})}{0.86 \times 47 \,\mu\text{F}}} \approx 90 \,\text{V}$$
(2)

$$V_{IN(MAX)DC} = \sqrt{2} \times V_{IN(MAX)AC} = \sqrt{2} \times (265 V_{AC}) = 375 V$$
(3)

Where η is the estimated circuit efficiency, f_L is the line frequency, t_C is the estimated rectifier conduction time, C_{IN} is empirically selected to be 47μ F electrolytic capacitors.

The maximum duty cycle is set to be 45% at low line voltage 90VAC and the circuit efficiency is estimated to be 86%. Then in CCM the primary to secondary turn ratio $N_P/N_{S:}$

$$\frac{N_{p}}{N_{s}} = \frac{D_{CCM} \max \times V_{IN} \min}{(1 - D_{CCM} \max) \times V_{o}}$$

$$= \frac{0.45 \times 90}{(1 - 0.45) \times 12} = 6.136$$
(4)

EF25 core is selected for the transformer. The core minimum Ae is 0.51cm². The minimum turn of the primary winding is:

$$N_{p} \geq \frac{V_{in_min} \times D_{CCM_max} \times 10^{8}}{f_{max} \times \Delta B_{max} \times Ae_{min} (gaus \times cm^{2})}$$

$$= \frac{90 \times 0.45 \times 10^{8}}{75000 \times 2500 \times 0.51} = 42 T$$
(5)

VDD voltage is set to 13V, base on the data we can get primary, secondly and auxiliary turns:

$$\frac{N_A}{N_s} = \frac{V_{dd} + V_{d_aux}}{V_o + V_{d_sec}} = \frac{13 + 0.7}{12 + 0.45} = 1.1$$
(6)

$$N_{p} = 56T, N_{s} = 9T, N_{a} = 10T$$
 (7)

We set DCM/CCM boundary is 185Vac, then the duty at full load is:

$$D_{CCM} = \frac{V_o \times N_p}{V_{INDC} \times N_s + V_o \times N_p}$$

$$\frac{12 \times 56}{0.000} \qquad (8)$$

 $= \frac{12}{185 \times 1.414 \times 9 + 12 \times 56} = 0.22$

The peak current of primary is:

$$I_{ppk} = \frac{2 \times V_o \times I_o}{V_{in} \times D_{DCM} \times \eta}$$

$$2 \times 12 \times 2$$
(9)

 $= \frac{2 \times 12 \times 2}{185 \times 1.414 \times 0.22 \times 0.86} = 0.97 \text{ A}$

The primary inductance is:

$$L_m = \frac{V_{indc} \times D_{uly}}{I_{ppk} \times f_{sw}} = \frac{185 \times 1.414 \times 0.22}{0.97 \times 75000} = 0.8mH$$
(10)

Innovative Power[™]

Active-Semi Proprietary—For Authorized Recipients and Customers ActiveQR[™] is a trademark of Active-Semi.

TYPICAL APPLICATION CONT'D

Determining the value of the current sense resistor (R7) uses the maximum current in the design. So the input primary maximum current at maximum load:

$$I_{p_{-}OCP} = \sqrt{\frac{2 \times I_{OUT_{-}OCP} \times V_{OUT}}{L_{p} \times f_{sw} \times \eta}} = \sqrt{\frac{2 \times 2.6 \times 12}{0.8 \times 75 \times 0.86}} = 1.1A$$
 (11)

Since the ACT512 internal current limit is set to 0.96V, the design of the current sense resistor is given by:

$$R_{\rm CS} = \frac{V_{\rm CS}}{I_{\rm p_{-}OCP}} = \frac{0.96}{1.1} \approx 0.87\,\Omega \tag{12}$$

The voltage feedback resistors are selected according to the design. Because the line UVLO is 75VDC, the upper feedback resistor is given by:

$$R_{FB_{-}UP} = V_{INDC_{-}UVLO} \times \frac{N_{A}}{N_{p} \times I_{FB_{-}UVLO}}$$
(13)
= $\frac{60 \times 10}{56 \times 0.2 \, mA} \approx 54.9 \, k\Omega$

The lower feedback resistor is selected as:

$$R_{FB_LOW} = \frac{V_{FB}}{(V_{OUT} + V_D) \frac{N_A}{N_S} - V_{FB}} R_{FB_UP}$$

$$= \frac{2.2}{(12 + 0.45) \times 1.1 - 2.2} \times 54.9 k\Omega \approx 11.7 k\Omega$$
(14)

When selecting the output capacitor, a low ESR electrolytic capacitor is recommended to minimize ripple from the current ripple. The approximate equation for the output capacitance value is given by:

$$C_{OUT} = \frac{I_{OUT}}{f_{sw} \times V_{RIPPLE}} = \frac{2}{75k \times 50mV} = 533\,\mu\text{F}$$
(15)

Two 680μ F electrolytic capacitors are used to further reduce the output ripple.

PCB Layout Guideline

Good PCB layout is critical to have optimal performance. Decoupling capacitor (C4) and feedback resistor (R5/R6) should be placed close to VDD and FB pin respectively. There are two main power path loops. One is formed by C1/C2, primary winding, mosfet transistor and current sense resistor (R9). The other is secondary winding, rectifier D8 and output capacitors (C5/C6). Keep these loop areas as small as possible. Connecting high current ground returns, the input capacitor

ground lead, and the ACT512 GND pin to a single point (star ground configuration).
