### DESCRIPTION

NEC's UPC1663GV is a video amplifier with differential input and output stages. A high frequency process ( $f_T = 6$  GHz) improves AC performance compared with industry-standard video amplifiers. This device is excellent as a sense amplifier for high-density CCDs, as a video or pulse amplifier in high-resolution displays, and in communications equipment.

**Attention:**

Due to high frequency characteristics, the physical circuit layout is very critical. Supply voltage line bypass, double-sided printed-circuit board, and wide-area ground line layout are necessary for stable operation. Two signal resistors connected to both inputs and two load resistors connected to both outputs should be balanced for stable operation.

TYPICAL APPLICATIONS

• Photo Signal Detector

Since the input impedance of the IC falls when the gain rises, stable operation can be achieved by inserting a FET buffer when necessary as illustrated above.

• Application for +5 V Single Supply
