FUNCTIONAL DESCRIPTION

The Am54S/74S350 is a combinatorial logic circuit that accepts a four-bit data word and shifts the word 0, 1, 2 or 3 places. The number of places to be shifted is determined by a two-bit select field S_0 and S_1 . An active-LOW enable controls the three-state outputs. This feature allows expansion of shifting over a larger number of places with one delay.

By suitable interconnection, the Am54S/74S350 can be used to shift any number of bits any number of places up or down. Shifting can be logical, with logic zeroes pulled in at either or both ends of the shifting field; arithmetic, where the sign bit is repeated during a shift down; or end around, where the data word forms a continuous loop.
