

Dual-Channel Isolators with Integrated DC/DC Converter, 50 mW ADuM5240/ADuM5241/ADuM5242

Preliminary Technical Data

FEATURES

Integrated isolated DC/DC converter Regulated 5V/10 mA output Dual dc-to-10 Mbps (NRZ) signal isolation channels Narrow body SOIC 8-lead package High temperature operation: 105°C Precise timing characteristics: 3 ns maximum pulse-width distortion 3 ns maximum channel-to-channel matching 70 ns maximum propagation delay High common-mode transient immunity: > 25 kV/µs Safety and regulatory approvals (pending) **UL** recognition 2500 V rms for 1 minute per UL 1577 CSA component acceptance notice #5A VDE certificate of conformity DIN EN 60747-5-2 (VDE 0884 Part 2): 2003-01 DIN EN 60950 (VDE 0805): 2001-12; DIN EN 60950: 2000 V_{IORM} = 425 V peak

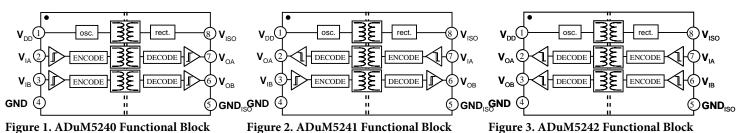

GENERAL DESCRIPTION

The ADuM524x¹ are dual-channel digital isolators having an integrated DC/DC converter. Based on Analog Devices' *i*Coupler[®] technology, the DC/DC converter provides up to 50 mW of regulated, isolated power at +5V. This eliminates the need for a separate isolated DC/DC converter in low-power isolated designs. Analog Devices' chip-scale transformer *i*Coupler^{*} technology is used both for the isolation of the logic signals as well as for the DC/DC converter. The result is a small form-factor total-isolation solution.

ADuM524x units may be used in combination or with other *i*Coupler products to achieve greater channel counts.

The ADuM524x isolators provide two independent isolation channels in a variety of channel configurations and data rates (see Ordering Guide) operating off a 5V input supply.

¹ Protected by U.S. Patents 5,952,849 6,873,065 and 7,075,329 Other patents pendina.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS¹

All voltages are relative to their respective ground. All min/max specifications apply over the entire recommended operating range, unless otherwise noted. All typical specifications are at $T_A = 25^{\circ}$ C, $V_{DD} = 5.0$ V, $V_{ISO} = 5.0$ V.

Common-Mode Transient Immunity at Logic High Output	CM _H	25	35		kV/μs	$V_{Ix} = V_{DD}$, V_{ISO} , $V_{CM} = 1000$ V, transient magnitude = 800 V
Common-Mode Transient Immunity at Logic Low Output	CM∟	25	35		kV/µs	$V_{ix} = 0 V, V = 1000 V,$ transient magnitude = 800 V
Refresh Frequency	fr		1.0		MHz	

¹ All voltages are relative to their respective ground.

² Supply current values are specified with no load present on the digital outputs.

³ Supply current values are specified with no load present on the digital outputs.

⁴ Enable/disable threshold is the voltage at which the internal DC/DC converter is enabled/disabled.

⁵ The minimum pulse width is the shortest pulse width at which the specified pulse-width distortion is guaranteed.

⁶ The maximum data rate is the fastest data rate at which the specified pulse-width distortion is guaranteed.

⁷ t_{PHL} propagation delay is measured from the 50% level of the falling edge of the V_{Ix} signal to the 50% level of the falling edge of the V_{ox} signal. t_{PLH} propagation delay is measured from the 50% level of the rising edge of the V_{ix} signal to the 50% level of the rising edge of the V_{ox} signal.

⁸ t_{PSK} is the magnitude of the worst-case difference in t_{PHL} and/or t_{PLH} that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.

⁹ Channel-to-channel matching is the absolute value of the difference in propagation delays between the two channels when operated with identical loads.

¹⁰ Channel-to-channel matching is the absolute value of the difference in propagation delays between the two channels when operated with identical loads.

¹¹ Ripple occurs at frequency corresponding to the input signal data rate or the refresh frequency for data rates below 1Mbps.

¹² Enable time is the duration from when input supply voltage rises above the enable threshold to when the internal DC/DC converter starts charging an external load. Disable time is the duration from when the input supply voltage drops below the disable threshold to when the internal DC/DC converter stops charging an external load.

¹ All voltages are relative to their respective ground.

² See Figure 4 for maximum rated current values for various temperatures.

³ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the Absolute Maximum Rating may cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; Functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATION INFORMATION DC/DC CONVERTER

The ADuM524x can be operated with the internal DC/DC enabled or disabled. With the internal DC/DC converter enabled, the Pin 8 isolated supply provides output power as well as power to the part's isolated-side circuitry. Since the power consumed by the ADuM524x is a function of the input signals' data rate, the available isolated output power is determined by the data rate at which the part's data channels are operating.

The ADuM524x's internal DC/DC converter state is controlled by the input V_{DD} voltage as defined in Table 6. In normal operating mode, V_{DD} is set between 4.5 V and 5.5 V and the internal DC/DC converter is enabled. When/if it is desired to disable the DC/DC converter, V_{DD} is lowered to a value between 2.7 V and 4.0 V. In this mode, the V_{ISO} supply is supplied by the user and the ADuM524x's signal channels continue to operate normally.

GUIDELINES FOR PRE-PRODUCTION SAMPLES

Pre production samples meet all data sheet specifications; however, a limitation in the internal circuitry of the ADuM524x prevents proper start-up under all load conditions. This limitation will be corrected in the final product.

At certain temperature and load conditions the ADuM524x will not regulate its V_{ISO} output to the 5.25V target voltage at converter start-up. The output stabilizes at just under 4V with no external load or as low as 3V with an external load. If the converter starts successfully, the output voltage will continue to regulate properly even as temperature and load conditions change.

The start-up issue is affected by several circuit and environmental conditions: slew rate applied to V_{DD1} , ambient temperature, and V_{ISO} capacitive load. The recommendations in the PC board layout section address the V_{DD1} slew rate dependence in most cases. Good results have been obtained when the system power supply slews at ~0.5V/µS. Faster slew rates can be tolerated but should be verified over temperature. Table 14 contains guidelines for the maximum reliable start-up temperature for two common values of load capacitance.

The V_{ISO} start-up issue is strongly temperature dependant. The ADuM542x dissipates between 40 and 63mW under normal operation, causing the internal temperature of the device to be higher than ambient during normal operation. A "warm start" after the device has reached its equilibrium temperature is the worst case condition and will give the highest probability of incorrect regulation of output voltage. The guidelines in Table 14 are based on "warm start" at full load. Cold start will be successful at higher ambient temperatures.

When these guidelines are followed, pre-production samples may be used for prototype and evaluation. As mentioned above this issue will be corrected in final silicon and the ADuM524x will operate at specified load and temperature conditions.

Table 14. Special Usage Conditions for Pre-productionDevices

Max Temperature by Load Capacitance ¹						
	10nF	100nF				
ADuM5240	105°C	Not Recommended				
ADuM5241	105°C	65°C				
ADuM5242	80°C	80°C				

¹ Value of load capacitor C3 in Figure 8

PC BOARD LAYOUT

The ADuM524x digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins as shown in Figure 8. For the ADuM5240 and ADuM5241, a bypass capacitance (C_1) of 44 μ F is required at the V_{DD} input to ensure proper power-up. For all models bypass capacitance is recommended with C_2 =0.1 μ F on the non-isolated side and C_3 =10 nF on the isolated side. Due to high inductance associated with larger capacitors such as C_1 , it is recommended that both C_1 and C_2 be used on the ADuM5240 and ADuM5241. The bypass capacitors should be placed as close as possible to the ADuM524x device.

In cases where EMI is a concern, inductance should be added between the system supply and ground and the ADuM524x supply and ground as shown in Figure 8. Inductance can be added in the form of discrete inductors or ferrite beads, and it's recommended the value correspond to an impedance between 50Ω and 100Ω at approximately 300MHz.

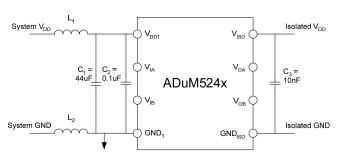

Figure 8. Recommended Application Circuit. C_1 may be omitted for ADuM5242, and L_1 and L_2 should be included where EMI is a concern.

OUTLINE DIMENSIONS
