

# HT24LC02 CMOS 2K 2-Wire Serial EEPROM

## **Features**

- · Operating voltage:
  - 2.2V~5.5V for temperature -40°C to +85°C
- · Low power consumption
  - Operation: 5mA max.
  - Standby: 2μA max.
- Internal organization: 256×8
- 2-wire serial interface
- Write cycle time: 5ms max.
- Automatic erase-before-write operation

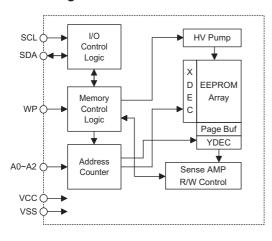

- · Partial page write allowed
- 8-byte Page write modes
- · Write operation with built-in timer
- · Hardware controlled write protection
- 40-year data retention
- 10<sup>6</sup> erase/write cycles per word
- Industrial temperature range (-40°C to +85°C)
- 8-pin DIP/SOP/TSSOP, SOT23-5 package.

# **General Description**

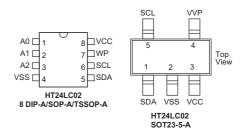

The HT24LC02 is a 2K-bit serial read/write non-volatile memory device using the CMOS floating gate process. Its 2048 bits of memory are organized into 256 words and each word is 8 bits. The device is optimized for use in many industrial and commercial applications where

low power and low voltage operation are essential. Up to eight HT24LC02 devices may be connected to the same 2-wire bus. The HT24LC02 is guaranteed for 1M erase/write cycles and 40-year data retention.

## **Block Diagram**

# **Pin Assignment**

Note: For use of SOT23-5 package, the software A2, A1, and A0 bits in the device address word must be set to zero to properly communicate.

## **Pin Description**

| Pin Name | I/O | Description                   |
|----------|-----|-------------------------------|
| A0~A2    | I   | Address inputs                |
| SDA      | I/O | Serial data inputs/output     |
| SCL      | I   | Serial clock data input       |
| WP       | I   | Write protect                 |
| VSS      | _   | Negative power supply, ground |
| VCC      | _   | Positive power supply         |

# **Absolute Maximum Ratings**

| Supply VoltageV <sub>SS</sub> -0.3V to V <sub>SS</sub> +6.0V | Storage Temperature50°C to 125°C  |
|--------------------------------------------------------------|-----------------------------------|
| Input VoltageV <sub>SS</sub> -0.3V to V <sub>CC</sub> +0.3V  | Operating Temperature40°C to 85°C |

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Note: These parameters are periodically sampled but not 100% tested

<sup>\*</sup> The standard mode means  $V_{CC}$ = 2.2V to 5.5V at Ta=  $-40^{\circ}$ C to +85°C For relative timing, refer to timing diagrams

## **Functional Description**

Serial clock (SCL)

The SCL input is used for positive edge clock data into each EEPROM device and negative edge clock data out of each device.

· Serial data (SDA)

The SDA pin is bidirectional for serial data transfer. The pin is open-drain driven and may be wired-OR with any number of other open-drain or open collector devices.

• A0, A1, A2

The A2, A1 and A0 pins are device address inputs that are hard wired for the HT24LC02. As many as eight 2K devices may be addressed on a single bus system (the device addressing is discussed in detail under the Device Addressing section).

Write protect (WP)

The HT24LC02 has a write protect pin that provides hardware data protection. The write protect pin allows normal read/write operations when connected to the  $V_{SS}$ . When the write protect pin is connected to Vcc, the write protection feature is enabled and operates as shown in the following table.

| WP Pin<br>Status   | Protect Array                |  |  |
|--------------------|------------------------------|--|--|
| At V <sub>CC</sub> | Full Array (2K)              |  |  |
| At V <sub>SS</sub> | Normal Read/Write Operations |  |  |

## **Memory Organization**

 HT24LC02, 2K Serial EEPROM Internally organized with 256 8-bit words, the 2K requires an 8-bit data word address for random word addressing.

## **Device Operations**

· Clock and data transition

Data transfer may be initiated only when the bus is not busy. During data transfer, the data line must remain stable whenever the clock line is high. Changes in data line while the clock line is high will be interpreted as a START or STOP condition.

· Start condition

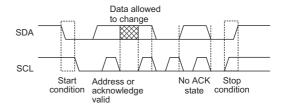

A high-to-low transition of SDA with SCL high is a start condition which must precede any other command (refer to Start and Stop Definition Timing diagram).

· Stop condition

A low-to-high transition of SDA with SCL high is a stop condition. After a read sequence, the stop command will place the EEPROM in a standby power mode (refer to Start and Stop Definition Timing Diagram).

#### Acknowledge

All addresses and data words are serially transmitted to and from the EEPROM in 8-bit words. The EEPROM sends a zero to acknowledge that it has received each word. This happens during the ninth clock cycle.

### **Device Addressing**

The 2K EEPROM devices all require an 8-bit device address word following a start condition to enable the chip for a read or write operation. The device address word consist of a mandatory one, zero sequence for the first four most significant bits (refer to the diagram showing the Device Address). This is common to all the EEPROM device.

The next three bits are the A2, A1 and A0 device address bits for the 2K EEPROM. These three bits must compare to their corresponding hard-wired input pins.

The 8th bit of device address is the read/write operation select bit. A read operation is initiated if this bit is high and a write operation is initiated if this bit is low.

If the comparison of the device address succeed the EEPROM will output a zero at ACK bit. If not, the chip will return to a standby state.

## Write Operations

Byte write

A write operation requires an 8-bit data word address following the device address word and acknowledgment. Upon receipt of this address, the EEPROM will again respond with a zero and then clock in the first 8-bit data word. After receiving the 8-bit data word, the EEPROM will output a zero and the addressing device, such as a microcontroller, must terminate the write sequence with a stop condition. At this time the EEPROM enters an internally-timed write cycle to the non-volatile memory. All inputs are disabled during this write cycle and EEPROM will not respond until the write is completed (refer to Byte write timing).

#### · Page write

The 2K EEPROM is capable of an 8-byte page write. A page write is initiated the same as byte write, but the microcontroller does not send a stop condition after the first data word is clocked in. Instead, after the EEPROM acknowledges the receipt of the first data word, the microcontroller can transmit up to seven more data words. The EEPROM will respond with a zero after each data word received. The microcontroller must terminate the page write sequence with a stop condition.

The data word address lower three (2K) bits are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location (refer to Page write timing).

#### · Acknowledge polling

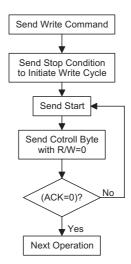

To maximise bus throughput, one technique is to allow the master to poll for an acknowledge signal after the start condition and the control byte for a write command have been sent. If the device is still busy implementing its write cycle, then no ACK will be returned. The master can send the next read/write command when the ACK signal has finally been received.

## Write protect

The HT24LC02 has a write-protect function and programming will then be inhibited when the WP pin is connected to VCC. Under this mode, the HT24LC02 is used as a serial ROM.

## Read operations

The HT24LC02 supports three read operations, namely, current address read, random address read and sequential read. During read operation execution, the read/write select bit should be set to "1".

**Acknowledge Polling Flow** 

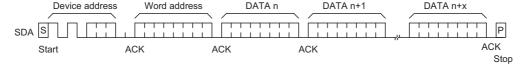

#### · Current address read

The internal data word address counter maintains the last address accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address roll over during read from the last byte of the last memory page to the first byte of the first page. The address roll over during write from the last byte of the current page to the first byte of the same page. Once the device address with the read/write select bit set to one is clocked in and acknowledged by the EEPROM, the current address data word is serially clocked out. The microcontroller should respond a No ACK (High) signal and following stop condition (refer to Current read timing).

## Byte Write Timing

# **Page Write Timing**

#### **Current Read Timing**

#### Random read

A random read requires a dummy byte write sequence to load in the data word address which is then clocked in and acknowledged by the EEPROM. The microcontroller must then generate another start condition. The microcontroller now initiates a current address read by sending a device address with the read/write select bit high. The EEPROM acknowledges the device address and serially clocks out the data word. The microcontroller should respond with a "no ACK" signal (high) followed by a stop condition. (refer to Random read timing).

#### · Sequential read

Sequential reads are initiated by either a current address read or a random address read. After the microcontroller receives a data word, it responds with an acknowledgment. As long as the EEPROM receives an acknowledgment, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will roll over and the sequential read continues. The sequential read operation is terminated when the microcontroller responds with a "no ACK" signal (high) followed by a stop condition.

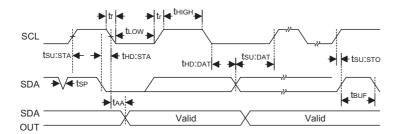

#### **Random Read Timing**

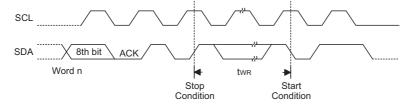

#### **Sequential Read Timing**

## **Timing Diagrams**

Note: The write cycle time t<sub>WR</sub> is the time from a valid stop condition of a write sequence to the end of the valid start condition of sequential command.
