## GENERAL DESCRIPTION

The HSD8M64F8V/VA is a 8M x 64 bit Synchronous Dynamic RAM high density memory module. The module consists of eight CMOS 2M x 8 bit with 4banks Synchronous DRAMs in TSOP-II packages is mounted on a 120-pin, double-sided, FR-4-printed circuit board., Two 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each SDRAM. The HSD8M64F8V/VA is a SMM (Stackable Memory Module) designed and is intended for mounting into two 60-pin connector sockets. Synchronous design allows precise cycle control with the use of system clock. I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable latencies allows the same device to be useful for a variety of high bandwidth, high performance memory system applications All module components may be powered from a single 3.3V DC power supply and all inputs and outputs are LVTTTL-compatible.

FUNCTIONAL BLOCK DIAGRAM

**PIN FUNCTION DESCRIPTION**

Pin	Name	Input Function
CLK	System clock	Active on the positive going edge to sample all inputs.
/CE	Chip enable	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	Clock enable	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby. CKE should be enabled 1CLK+tSS prior to valid command.
A0 ~ A11	Address	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA11, Column address : CA0 ~ CA8
BA0 ~ BA1	Bank select address	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
/RAS	Row address strobe	Latches row addresses on the positive going edge of the CLK with RAS low. Enables row access & precharge.
/CAS	Column address strobe	Latches column addresses on the positive going edge of the CLK with CAS low. Enables column access.
/WE	Write enable	Enables write operation and row precharge. Latches data in starting from CAS, WE active.
DQM0 ~ 7	Data input/output mask	Makes data output Hi-Z, tSHZ after the clock and masks the output. Blocks data input when DQM active. (Byte masking)
DQ0 ~ 63	Data input/output	Data inputs/outputs are multiplexed on the same pins.
VCC/VSS	Power supply/ground	Power and ground for the input buffers and the core logic.

**ABSOLUTE MAXIMUM RATINGS**

**Notes :**

- Parameters depend on programmed CAS latency.
- If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
- Assumed input rise and fall time (tr & tf) = 1ns.  
If tr & tf is longer than 1ns, transient time compensation should be considered, ie., [(tr + tf)/2-1]ns should be added to the parameter.

**Notes :**

- OP Code : Operand code  
A0 ~ A11 & BA0 ~ BA1 : Program keys. (@ MRS)
- MRS can be issued only at all banks precharge state.  
A new command can be issued after 2 CLK cycles of MRS.
- Auto refresh functions are as same as CBR refresh of DRAM.  
The automatical precharge without row precharge command is meant by "Auto".  
Auto/self refresh can be issued only at all banks precharge state.
- BA0 ~ BA1 : Bank select addresses.  
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.  
If both BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank B is selected.  
If both BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank C is selected.  
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.  
If A10/AP is "High" at row precharge, BA0 and BA1 is ignored and all banks are selected.
- During burst read or write with auto precharge, new read/write command can not be issued.  
Another bank read/write command can be issued after the end of burst.  
New row active of the associated bank can be issued at tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
