

**600V, SMPS Series N-Channel IGBT**

The HGTD3N60A4S, HGT1S3N60A4S and the HGTP3N60A4 are MOS gated high voltage switching devices combining the best features of MOSFETs and bipolar transistors. These devices have the high input impedance of a MOSFET and the low on-state conduction loss of a bipolar transistor. The much lower on-state voltage drop varies only moderately between 25°C and 150°C.

This IGBT is ideal for many high voltage switching applications operating at high frequencies where low conduction losses are essential. **This device has been optimized for high frequency switch mode power supplies.**

Formerly Developmental Type TA49327.

**Ordering Information**

PART NUMBER	PACKAGE	BRAND
HGTD3N60A4S	TO-252AA	3N60A4
HGT1S3N60A4S	TO-263AB	3N60A4
HGTP3N60A4	TO-220AB	3N60A4

NOTE: When ordering, use the entire part number. Add the suffix 9A to obtain the TO-252AA or the TO-263AB in tape and reel, i.e. HGT1S3N60A4S9A

**Symbol**

**Features**

- >100kHz Operation at 390V, 3A
- 200kHz Operation at 390V, 2.5A
- 600V Switching SOA Capability
- Typical Fall Time. . . . . 70ns at T<sub>J</sub> = 125°C
- 12mJ E<sub>AS</sub> Capability
- Low Conduction Loss
- *Temperature Compensating SABER™* Model

## Absolute Maximum Ratings $T_C = 25^\circ\text{C}$ , Unless Otherwise Specified

	ALL TYPES	UNITS
Collector to Emitter Voltage . . . . .	600	V
Collector Current Continuous		
At $T_C = 25^\circ\text{C}$ . . . . .	17	A
At $T_C = 110^\circ\text{C}$ . . . . .	8	A
Collector Current Pulsed (Note 1) . . . . .	40	A
Gate to Emitter Voltage Continuous . . . . .	$\pm 20$	V
Gate to Emitter Voltage Pulsed . . . . .	$\pm 30$	V
Switching Safe Operating Area at $T_J = 150^\circ\text{C}$ , Figure 2 . . . . .	15A at 600V	
Single Pulse Avalanche Energy at $T_C = 25^\circ\text{C}$ . . . . .	12mJ at 3A	
Power Dissipation Total at $T_C = 25^\circ\text{C}$ . . . . .	70	W
Power Dissipation Derating $T_C > 25^\circ\text{C}$ . . . . .	0.56	W/ $^\circ\text{C}$
Operating and Storage Junction Temperature Range. . . . .	-55 to 150	$^\circ\text{C}$
Maximum Lead Temperature for Soldering		
Leads at 0.063in (1.6mm) from Case for 10s. . . . .	300	$^\circ\text{C}$
Package Body for 10s, See Tech Brief 334 . . . . .	260	$^\circ\text{C}$

*CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.*

**NOTE:**

1. Pulse width limited by maximum junction temperature.

## Electrical Specifications $T_J = 25^\circ\text{C}$ , Unless Otherwise Specified

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNITS	
Collector to Emitter Breakdown Voltage	$BV_{CES}$	$I_C = 250\mu\text{A}$ , $V_{GE} = 0\text{V}$	600	-	-	V

## Electrical Specifications $T_J = 25^\circ\text{C}$ , Unless Otherwise Specified (Continued)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNITS
Current Turn-On Delay Time	$t_{d(ON)I}$	IGBT and Diode at $T_J = 125^\circ\text{C}$ $I_{CE} = 3\text{A}$ $V_{CE} = 390\text{V}$ $V_{GE} = 15\text{V}$ $R_G = 50\Omega$ $L = 1\text{mH}$ Test Circuit - Figure 20	-	5.5	8	ns
Current Rise Time	$t_{rI}$		-	12	15	ns
Current Turn-Off Delay Time	$t_{d(OFF)I}$		-	110	165	ns
Current Fall Time	$t_{fI}$		-	70	100	ns
Turn-On Energy (Note 3)	$E_{ON1}$		-	37	-	$\mu\text{J}$
Turn-On Energy (Note 3)	$E_{ON2}$		-	90	100	$\mu\text{J}$
Turn-Off Energy (Note 2)	$E_{OFF}$		-	50	80	$\mu\text{J}$
Thermal Resistance Junction To Case	$R_{\theta JC}$		-	-	1.8	$^\circ\text{C/W}$

### NOTES:

- Turn-Off Energy Loss ( $E_{OFF}$ ) is defined as the integral of the instantaneous power loss starting at the trailing edge of the input pulse and ending at the point where the collector current equals zero ( $I_{CE} = 0\text{A}$ ). All devices were tested per JEDEC Standard No. 24-1 Method for Measurement of Power Device Turn-Off Switching Loss. This test method produces the true total Turn-Off Energy Loss.
- Values for two Turn-On loss conditions are shown for the convenience of the circuit designer.  $E_{ON1}$  is the turn-on loss of the IGBT only.  $E_{ON2}$  is the turn-on loss when a typical diode is used in the test circuit and the diode is at the same  $T_J$  as the IGBT. The diode type is specified in Figure 20.

## Handling Precautions for IGBTs

Insulated Gate Bipolar Transistors are susceptible to gate-insulation damage by the electrostatic discharge of energy through the devices. When handling these devices, care should be exercised to assure that the static charge built in the handler's body capacitance is not discharged through the device. With proper handling and application procedures, however, IGBTs are currently being extensively used in production by numerous equipment manufacturers in military, industrial and consumer applications, with virtually no damage problems due to electrostatic discharge. IGBTs can be handled safely if the following basic precautions are taken:

1. Prior to assembly into a circuit, all leads should be kept shorted together either by the use of metal shorting springs or by the insertion into conductive material such as "ECCOSORB<sup>TM</sup> LD26" or equivalent.
2. When devices are removed by hand from their carriers, the hand being used should be grounded by any suitable means - for example, with a metallic wristband.
3. Tips of soldering irons should be grounded.
4. Devices should never be inserted into or removed from circuits with power on.
5. **Gate Voltage Rating** - Never exceed the gate-voltage rating of  $V_{GEM}$ . Exceeding the rated  $V_{GE}$  can result in permanent damage to the oxide layer in the gate region.
6. **Gate Termination** - The gates of these devices are essentially capacitors. Circuits that leave the gate open-circuited or floating should be avoided. These conditions can result in turn-on of the device due to voltage buildup on the input capacitor due to leakage currents or pickup.
7. **Gate Protection** - These devices do not have an internal monolithic Zener diode from gate to emitter. If gate protection is required an external Zener is recommended.

## Operating Frequency Information

Operating frequency information for a typical device (Figure 3) is presented as a guide for estimating device performance for a specific application. Other typical frequency vs collector current ( $I_{CE}$ ) plots are possible using the information shown for a typical unit in Figures 6, 7, 8, 9 and 11. The operating frequency plot (Figure 3) of a typical device shows  $f_{MAX1}$  or  $f_{MAX2}$ ; whichever is smaller at each point. The information is based on measurements of a typical device and is bounded by the maximum rated junction temperature.

$f_{MAX1}$  is defined by  $f_{MAX1} = 0.05 / (t_{d(OFF)I} + t_{d(ON)I})$ . Deadtime (the denominator) has been arbitrarily held to 10% of the on-state time for a 50% duty factor. Other definitions are possible.  $t_{d(OFF)I}$  and  $t_{d(ON)I}$  are defined in Figure 21. Device turn-off delay can establish an additional frequency limiting condition for an application other than  $T_{JM}$ .

$f_{MAX2}$  is defined by  $f_{MAX2} = (P_D - P_C) / (E_{OFF} + E_{ON2})$ . The allowable dissipation ( $P_D$ ) is defined by  $P_D = (T_{JM} - T_C) / R_{\theta JC}$ . The sum of device switching and conduction losses must not exceed  $P_D$ . A 50% duty factor was used (Figure 3) and the conduction losses ( $P_C$ ) are approximated by  $P_C = (V_{CE} \times I_{CE}) / 2$ .

$E_{ON2}$  and  $E_{OFF}$  are defined in the switching waveforms shown in Figure 21.  $E_{ON2}$  is the integral of the instantaneous power loss ( $I_{CE} \times V_{CE}$ ) during turn-on and  $E_{OFF}$  is the integral of the instantaneous power loss ( $I_{CE} \times V_{CE}$ ) during turn-off. All tail losses are included in the calculation for  $E_{OFF}$ ; i.e., the collector current equals zero ( $I_{CE} = 0$ ).
