

**Features**

- Operating Voltage: 1.8V to 5.5V
- Built-in N-MOS, 100mΩ(typ)  $R_{DS,ON}$
- Quiescent Current: 60μA(typ)
- Shutdown Current <1μA
- Built-in Current Limit
- Built-in Soft-Start.
- Built-in Under Voltage Lock Function
- Built-in Thermal Protection
- TTL Control Input
- SOT-23-5 Package

**Applications**

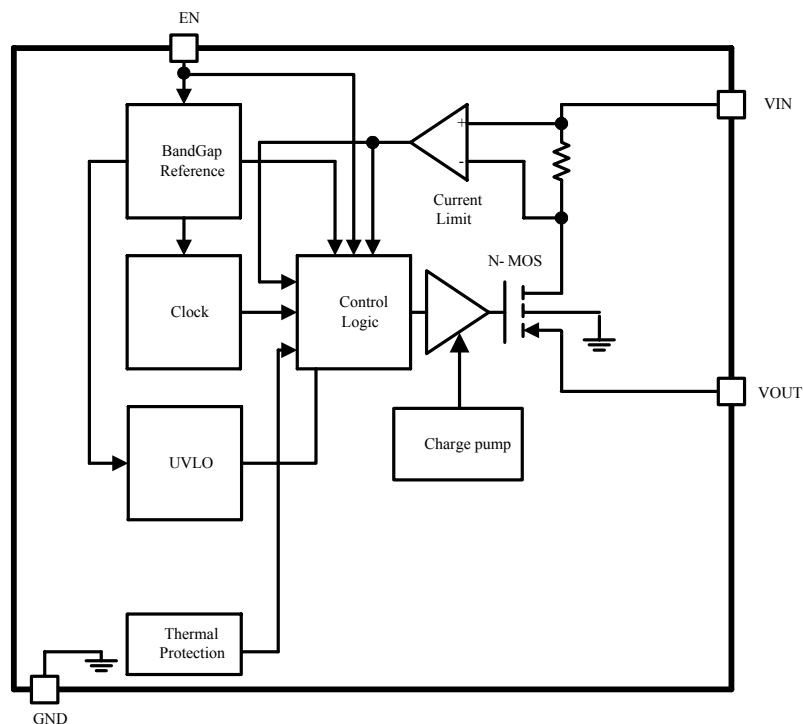

- USB Power Measurement
- Notebook computers
- Battery-Charger Circuits
- Hot Plug-in Power Supplies

**General Description**

The AT1605 is a smart high-side power switch to be able to supply up 2.0A from input source. The device features preventable reverse current flow from OUT to Input by free of parasitic body diode, when output voltage exceeds the input voltage, the N-MOS is turned off. The AT1605 includes built-in low on-resistance of NMOS to saved conductive loss, charge pump circuitry to drive N-MOS, built-in current limit, soft-start, thermal protection and under voltage lock function. Operating voltage range between 1.8V and 5.5V supports one Li-Ion or adaptor source.

The device is ideal for notebook computer, self-powered and bus powered USB application. The low quiescent current is conducive to saved power consumption. The AT1605 is available in 5-pin SOT-23-5 packages.

## **Function Description**

### **Enable Control**

Digital logic of EN provides an electrical ON/OFF control of the power supply. Connecting this pin to ground or to any voltage less than EN input threshold will completely turn OFF the Bias. In this state, current drain from the input supply is less than 1 $\mu$ A; the internal reference, comparators, and biasing circuitry turn off. EN works as a simple on/off control. Drive EN high to enable the device, or drive EN low for shutdown.

### **Charge Pump**

The higher of supply battery powers the internal charge pump. The charge pump provides power to the current limit amplifier and allows the N-MOS gate voltage to be higher the battery supply voltage. A gate voltage that is higher than the source voltage is necessary to turn on the N-MOS.

### **Under-Voltage Lockout (UVLO)**

The under voltage lockout prevents the device from misoperation at low input voltage.

### **Soft-Start**

Soft-start is built-in on chip. When power up, the soft-start function is immediately active to nominal voltage by a constant current. During this time, the soft-start voltage directly controls the N-MOS on-time to reduce input surge currents. The maximum load current is available after the soft-start cycle is completed.

### **Over-Current Limit**

The AT1605 provides cycle-by-cycle over-current protection. Current limit is accomplished using a separate dedicated comparator. The current limit signals control logic block to limit current of N-MOS in event that the current of flowing N-MOS is greater than the current limit value. The current-limit feature protection against a hard short or over-current fault at the output.

### **Thermal-Overload Protection**

Thermal-overload protection limits total power dissipation in the AT1605. When the junction temperature exceeds  $T_j=130^{\circ}\text{C}$ , a thermal sensor activates the thermal protection, which shuts down the IC, allowing the IC to cool. Once the device cools down by  $20^{\circ}\text{C}$ , IC will automatically recover normal operation. For continuous operation, do not exceed the absolute maximum junction-temperature rating of  $T_j=150^{\circ}\text{C}$ .
