General Description

The HMC851LC3C is a XOR/XNOR gate function designed to support data transmission rates of up to 28 Gbps, and clock frequencies as high as 28 GHz. The HMC851LC3C also features an output level control pin, VR, which allows for loss compensation or for signal level optimization.

All input signals to the HMC851LC3C are terminated with 50 ohms to ground on-chip, and may be either AC or DC coupled. The differential outputs of the HMC851LC3C may be either AC or DC coupled. Outputs can be connected directly to a 50 ohm to ground terminated system, while DC blocking capacitors may be used if the terminating system is 50 ohms to a non-ground DC voltage. The HMC851LC3C operates from a single -3.3 V DC supply, and is available in a ceramic RoHS compliant 3x3 mm SMT package.

[2] Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. The exposed metal package base must be connected to Vee. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request. Install jumper on JP1 to short VR to GND for normal operation.
