FUNCTIONAL DESCRIPTION

Standby Function

The oscillator stops when $\overline{\text{INH}}$ goes LOW. When the oscillator stops, the oscillator output on Q goes high impedance.

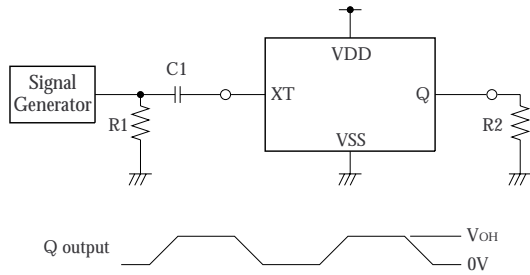

$\overline{\text{INH}}$	Q	Oscillator
HIGH (or open)	f_0 output frequency	Normal operation
LOW	High impedance	Stopped

Power-save Pull-up Resistance

The $\overline{\text{INH}}$ pull-up resistance changes in response to the input level (HIGH or LOW). When $\overline{\text{INH}}$ goes LOW (standby state), the pull-up resistance becomes large to reduce the current consumption during standby.
