

### DESCRIPTION

The AMC3100 is a high efficiency synchronous buck DC/DC converter using a constant frequency, current mode architecture. Adjustable version and fixed output voltages of 1.2V, 1.5V and 1.8V are available. 300uA low supply current at no load and <1uA supply current at shutdown. The 2.5V to 5.5V input voltage range makes the AMC3100 ideally suited for single Li-Ion battery-powered applications. 100% duty cycle provides low dropout operation, extending battery life in portable systems. PWM pulse skipping mode operation provides very low output ripple voltage for noise sensitive applications.

Switching frequency is internally set at 1.5MHz, allowing using small surface mount inductors and capacitors. The internal synchronous switch increases efficiency and eliminates the need for an external Schottky diode. Low output voltages are easily supported with the 0.6V feedback reference voltage.

The AMC3100 is available in a low profile (1mm) Thin SOT-23-5L package.

**APPLICATION INFORMATION**

The basic AMC3100 application circuit is shown in Figure 1. External component selection is driven by load requirement:

**Adjustable Output Voltage:**

In adjustable version, the output voltage is set by the below formula (1):

$$V_{OUT} = 0.6V \left( 1 + \frac{R1}{R2} \right) \quad 0.6V \leq V_{OUT} \leq 5.5V \quad (1)$$

The external resistor divider sets the output voltage (see figure 1). Choose R1 around 1MΩ, R2 is then given by:

$$R2 = \frac{R1}{\left( \frac{V_{OUT}}{0.6V} - 1 \right)}$$

Figure 1

Table 1- Resistor Selection vs. Adjust Output Voltage.

V <sub>OUT</sub>	R1	R2
1.2V	1MΩ, 1%	1MΩ, 1%
1.5V	1MΩ, 1%	667KΩ, 1%
1.8V	1MΩ, 1%	500KΩ, 1%
2.5V	1MΩ, 1%	316KΩ, 1%
3.3V	1MΩ, 1%	222KΩ, 1%

**Inductor selection:**

For most applications, the value of the inductor will fall in the range of 1uH to 4.7uH. Its value is chosen based on the desired ripple current. Large value inductors lower ripple current, and small value inductors result in higher ripple currents.

Higher V<sub>IN</sub> or V<sub>OUT</sub> also increases the ripple current as shown in the formula (2):

$$\Delta I_L = \frac{V_{OUT}}{fL} \left( 1 - \frac{V_{OUT}}{V_{IN}} \right) \quad \text{Where, } f = \text{operating frequency, and } \Delta I_L = \text{ripple current in the inductor.} \quad (2)$$

**C<sub>OUT</sub> selection:**

The output capacitor keeps output voltage ripple small and ensures regulation loop stable. The output capacitor impedance shall be low in switching frequency. The output ripple ΔV<sub>OUT</sub> approximately:

$$\Delta V_{OUT} \cong \Delta I_L \left( ESR + \frac{1}{8fC_{OUT}} \right) \quad \text{Where, } C_{OUT} = \text{output capacitance.}$$
