PRODUCT DESCRIPTION

The ADN2882 is a compact, high performance 3.3 V power supply SiGe transimpedance amplifier (TIA) optimized for small form factor 4.25 Gbps metro-access, Ethernet PIN/APD-TIA modules and 1×/2×/4× Fibre channel receiver applications and meets OC48 SR/IR sensitivity requirements. The ADN2882 is a single-chip solution for detecting photodiode current with a differential output voltage. The ADN2882 features low input referred noise current of 600 nA enabling −22 dBm sensitivity; 3.2 GHz minimum bandwidth enables up to 4.25 Gbps operation; +3.25 dBm nominal operation at 10dB extinction ratio. RSSI output signal proportional to average input current is available for monitoring and alarm generation. To facilitate assembly in small form factor packages such as a TO-46 or TO-56 header, the ADN2882 integrates the photodiode filter network on chip and features 15 kHz low frequency cutoff without any external components. The ADN2882 chip area is less than 1 mm^2, operates with a 3.3 V power supply and is available in die form.

Stresses above those listed under Absolute Maximum Rating may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
