

DUAL OPERATIONAL AMPLIFIERS

DESCRIPTION

The AMC358 series is designed containing two independent, high gain operational amplifiers. It can operate from a single power supply over a wide range from 4.5V to 30V.

Not only it can be used in all conventional operation amplifiers circuits in single power supply systems, the AMC358 series is also ideal for transducer amplifiers, DC gain blocks and etc. In addition, without the need of $\pm 15V$ dual power supply voltages, the AMC358 series can be directly operated from the 5V power supply voltage which is also used for digital systems.

Short Circuit Output Current (Note 6)	I_{OS}	$V_{CC} = 15V$, $T_A = 25\text{ }^\circ\text{C}$		± 40	± 60	mA			

Note 2: $V_{OUT} \cong 1.4V$, $R_S = 0\Omega$, with V_{CC} from $4.5V$ to $30V$; and over the full input common-mode range ($0V$ to $V_{CC} - 1.5V$) at 25°C .

Note 3: Due to PNP input stage, the direction of the input current is out of the IC. It is essentially constant, independent of the state of the output, so no loading change exists on the input lines.

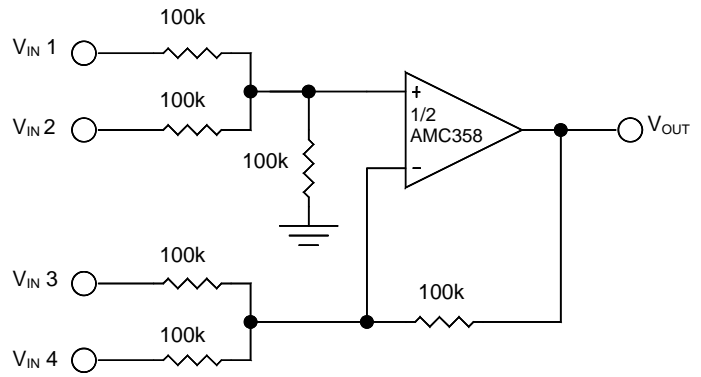

Note 4: The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than $0.3V$ (at 25°C). The upper limit of the common-mode voltage range is $V_{CC} - 1.5V$ (at 25°C), but either or both inputs can go to $32V$ without damage, independent of the magnitude of V_{CC} .

Note 5: These parameters, although guaranteed, are not tested in production.

Note 6: Short Circuits from the output to V_{CC} can cause excessive heating and eventual destruction. When considering short circuits to ground, the maximum output current is approximately 40mA independent of the magnitude of V_{CC} . At values of supply voltage in excess of $15V$, continuous short-circuit can exceed the power dissipation ratings and cause destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.
