

**40Pin Flash Disk Module Min.8MB ~ Max.384MB, True IDE Interface
Mode, 3.3V / 5.0V Operating** **Part No. HFDOM40P-xxxSx**

1. PRODUCT OVERVIEW

GENERAL DESCRIPTION

The HFDOM40P-xxxSx series 40Pin Flash Disk Module is a flash technology based with True IDE interface flash memory card. It is constructed with flash disk controller chip and NAND-type (Samsung) flash memory device. The HFDOM40P-xxxSx series operates in both 3.3-Volt and 5.0-Volt power supplies. It comes in capacity of 8, 16, 32, 64, 128, 192, 256 MB and up to 384 MB formatted 40Pin type .

By optimizing flash memory management, the life of this HFDOM40P-xxxSx series can be extended to its maximum level. Because the ECC function is included, the correctness of data transfer between the HFDOM40P-xxxSx series and a True IDE compatible interface device can be guaranteed.

The HFDOM40P-xxxSx series is fully compatible with applications such as CPU card / board, set top box, industry / military PC / Notebook, security equipment, measuring instrument and embedded systems.

FEATURES

- True IDE compatible host interface
- Direct plug in for 3.5" IDE Connectors
- 40 pin 2.54mm IDE Connector
- Very high performance, very low power consumption
- Automatic error correction
- Support 3 power save mode : stop/idle/active
- Support for CIS implemented with 256 bytes of attribute memory
- 3.3V/5.0V operation voltage
- Host data transfer rate : 20MB/s
- Flash data transfer rate : 10MB/s
- Host Interface bus width : 8/16 bit Access
- Flash Interface bus width : 8 bit Access
- Capacity : Min. 8MB ~ Max. 384MB
- MTBF : 1,000,000 hours, minimum 30,000 insertions
- Operating vibration : 15G peak to peak maximum
- Operating shock : 1,000G maximum

PRODUCT SPECIFICATIONS

Capacities :

8, 16, 32, 64, 128, 192, 256 and up to 384 MB (formatted)

Operating Voltage : 3.3V / 5.0V $\pm 10\%$

Power consumptions :

Read mode 30 mA (typ), 50 Ma (Max)

Write mode 30 mA (typ), 70 Ma (Max)

Stop mode 30 uA (typ)

Environment conditions :

Operating temperature 0°C to + 60°C

Storage temperature - 25°C to + 85°C

Relative humidity 95%(Max)

Mechanical conditions :

Weight : Maximum 9.0g

INSTALLTION GUIDE

1) Setting Method

- ① Make sure your computer is turned off before you open the case.
- ② Plug the carefully into the 40pin IDE slot on your computer.
Caution: Make sure to align pin1 on host adapter interface connector with pin 1 on your Flash Disk Module. Pin 1 is indicated by a triangle on the Flash Disk Module connector.
- ③ The Flash Disk Module is used power connector cable of the computer.
Caution: If you need to remove your Flash Disk Module, use both hands to pull it out carefully.
- ④ Check all cable connections and then replace your computer cover.

2) BIOS setting Method

Before you format or partition your new drive, you must configure your computer's BIOS so that the computer can recognize your new drive.

- ① Turn your computer on. As your computer start up, watch the screen for a message describing how to run the system setup program on the screen (sometimes called BIOS or CMOS setup). This is usually done by pressing a special key, such as **Delete**, **Esc** or **F1** during startup. See your computer manual for details. Press the appropriate key to run the system setup program.
- ② **If your BIOS provides automatic drive detection (an "AUTO" drive type), select this option. (We recommend to use Normal / CHS mode to partition your Flash Disk Module to get the maximum formatted capacity.)**

This allows your computer to configure itself automatically for your new drive.

If your BIOS dose not provide "AUTO" drive detection, select "User-defined" drive setting and enter the CHS values from the table. BIOS Settings (see specification) Capacity Cylinders Heads Sectors(unformatted)

- ③ Save the settings and exit the System Setup program. (your computer will automatically reboot) After you configure your computer, you can use the standard DOS commands to partition and format your Flash Disk Module, as described below.

3) Formatting Method

To partition your new Flash Disk Module with Microsoft DOS program :

- ① Insert a bootable DOS diskette into your diskette drive and restart your computer.
- ② Insert a DOS program diskette that contains the **FDISK.EXE** and **FORMAT.COM** programs into your diskette drive. Use the same DOS version that is on your bootable diskette. At the **A:\>** prompt, type **"FDISK"** and press **Enter**.
- ③ Select **"Create DOS partition or logical DOS drive"** by pressing **1**. Then press **Enter**.
- ④ Select **"Create primary DOS partition"** by pressing **1** again. Then press **Enter**.
Create your first drive partition. If you are creating a partition that will be used to boot your computer (drive C), make sure that the partition is marked active.
- ⑤ Create an extended partition and additional logical drives as necessary, until all the space on your new hard drive has been partitioned.
- ⑥ When the partitioning is complete, **FDISK** reboots your computer.
Caution: Make sure to use the correct drive letters so that you do not format a drive that already contains data.
- ⑦ At the **A:\>** prompt, type **"format c:/s"**, where **c** is the letter of your first new partition, Repeat the format process for all the new partitions you have created.
- ⑧ After you format your drive, it is ready to use.

Signal Descriptions

Table 2.2 Signal Descriptions

Signal Name	Dir.	Pin	Description
A[2:0]	I	33,35,36	In True IDE Mode only A[2:0] are used to select the one of eight registers in the Task File, the remaining address lines should be grounded by the host.
-PDIAG	I/O	34	This input / output is the Pass Diagnostic signal in the Master / Slave handshake protocol.
-DASP(LED)	I/O	39	This signal used either to drive an LED whenever the Disk Module is being accessed or as indication of a second drive present. This signal is active low when the Disk Module is busy.
-CS0, -CS1	I	37,38	CS0 is the chip select for the task file registers while CS2 is used to select the Alternate Status Register and the Device Control Register.
D[15:00]	I/O	3,4,5,6, 7,8,9,10, 11,12,13, 14,15,16, 17,18	All Task File operations occur in byte mode on the low order bus D00-D07 while all data transfers are 16 bit using D00-D15.
GND	--	2,19,22, 24,26, 30,40,	Ground.
-IOR	I	25	This is an I/O Read strobe generated by the host.
-IOW	I	23	The I/O Write strobe pulse is used to clock I/O data on the Card Data bus into the Storage Card controller registers when the Storage Card is configured to use the I/O interface. The clocking will occur on the negative to positive edge of the signal (trailing edge).
IRQ	O	31	In True IDE Mode signal is the active high Interrupt Request to the host.
-RESET	I	1	This input pin is the active low hardware reset from the host.
IORDY	O	27	This output signal may be used as IORDY.
-IOIS16	O	32	This output signal is asserted low when this device is expecting a word data transfer cycle.

ACCESS SPECIFICATIONS

IDE MODE I/O ACCESS SPECIFICATIONS

In this True IDE Mode the Flash Disk Module protocol and configuration are disabled and only I/O operations to the Task File and Data Register are allowed. In this mode no Memory or Attribute Registers are accessible to the host.
