## General Description

The AAT4670 SmartSwitch ${ }^{\text {TM }}$ is part of the Analogic Tech Application Specific Power MOSFET $\left(\right.$ ASPM $^{\text {M }}$ ) line of products. The AAT4670 consists of dual, independent, 1A current limited, slew rate controlled P-channel MOSFET power switches with a dedicated source and drain pin assigned to each switch. The internal circuitry automatically derives power from the higher of the two input power source pins with a low operating quiescent current of $18 \mu \mathrm{~A}$. In shutdown mode, the supply current decreases to less than $1 \mu \mathrm{~A}$. The switches operate with inputs ranging from 2.2 V to 5.5 V , making them ideal for $2.5 \mathrm{~V}, 3 \mathrm{~V}$ and 5 V systems. The dual configuration permits integration of the load switch function for systems with two different power busses. Independent under voltage lockout circuits will shut down the corresponding switch if its input voltage falls below the under voltage lockout threshold. If the die temperature reaches the thermal limit, both switches thermal cycle off and on indefinitely without damage until the thermal condition is removed. An open drain FAULT output signals an over current or over temperature condition for each channel. Input logic levels are TTL compatible.
The AAT4670 is available in 8 pin SOP, TSSOP or MSOP specified over -40 to $85{ }^{\circ} \mathrm{C}$ temperature range.

## Features

## SmartSwitch ${ }^{\text {w }}$

- 2.2 V to 5.5 V input voltage range
- 1A current limit per channel
- $95 \mathrm{~m} \Omega$ typical $\mathrm{R}_{\mathrm{DS}(0 \mathrm{O})}$
- Fast transient response:
- $<1 \mu$ response to short circuit
- Low $18 \mu \mathrm{~A}$ quiescent current
- $1 \mu \mathrm{~A}$ max with Switches off
- Slew rate controlled
- Thermal shutdown
- Fault flags with 3 ms blanking
- Under voltage lockout
- Temp range -40 to $85^{\circ} \mathrm{C}$
- 8-pin SOP, TSSOP or MSOP packages

## Applications

- Notebook Computer
- PDA, Subnotebook
- USB ports
- Peripheral ports
- Hot swap supplies
- Media bay

## Typical Application

## Pin Descriptions

| Pin \# | Symbol | Function |
| :---: | :---: | :--- |
| 1 | $\overline{\text { EN }}$ | Active-low Enable input (Logic low turns the switches on) |
| 2 | $\overline{\text { FAULTA }}$ | Open drain output signals over-current for OUTA and over-temperature condition |
| 3 | $\overline{\text { FAULTB }}$ | Open drain output signals over-current for OUTB and over-temperature condition |
| 4 | GND | Ground connection |
| 5 | OUTA | P-channel MOSFET drain channel A |
| 6 | INA | P-channel MOSFET source channel A |
| 7 | INB | P-channel MOSFET source channel B |
| 8 | OUTB | P-channel MOSFET drain channel B |

## Pin Configuration

|  | SOP-8 |
| :---: | :---: |
| EN $1 / \square$ | 8 OUTB |
| FAULTA ${ }^{2}$ | 7 INB |
| FAULTB ${ }^{3}$ | - INA |
| GND ${ }^{4}$ | 5 OUTA |

| TSSOP-8 |  | MSOP-8 |  |
| :---: | :---: | :---: | :---: |
| EN-1 ${ }^{\circ}$ | 8 OUTB | EN $\square^{\circ}$ | 8 OUTB |

| FAULTB ${ }^{3}$ | $\square_{6}$ INA | FAULTB ${ }^{3}$ | ${ }^{6}$ INA |
| GND ${ }^{4}$ | ${ }_{5}$ OUTA | GND ${ }^{4}$ | 5 OUTA |

## Absolute Maximum Ratings ( $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ unless otherwise noted)

| Symbol | Description | Value | Units |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\text {INA,B }}$ | INA or INB to GND | -0.3 to 6 | V |
| $\mathrm{~V}_{\text {OUTA,B }}$ | OUTA or OUTB to GND | -0.3 to 6 | V |
| $\mathrm{~V}_{\text {FAULTA,B }}$ | FAULTA or FAULTB to GND | -0.3 to 6 | V |
| $\mathrm{I}_{\text {OUT }}$ | Output Current | Internally Limited | A |
| $\mathrm{T}_{J}$ | Operating Junction Temperature Range | -40 to 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\text {ESD }}$ | ESD Rating ${ }^{1}-\mathrm{HBM}$ | 4000 | V |
| $\mathrm{~T}_{\text {LEAD }}$ | Maximum Soldering Temperature (at Leads) | 300 | ${ }^{\circ} \mathrm{C}$ |

Note: Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum rating should be applied at any one time.
Note 1: Human body model is a 100 pF capacitor discharged through a $1.5 \mathrm{k} \Omega$ resistor into each pin.

## Thermal Characteristics

| Symbol | Description | Value | Units |
| :---: | :--- | :---: | :---: |
| $\Theta_{\mathrm{JA}}$ | Maximum Thermal Resistance ${ }^{2}($ SOP-8) | 100 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{P}_{\mathrm{D}}$ | Maximum Power Dissipation ${ }^{2}($ SOP-8) | 1.25 | W |

Note 2: Mounted on a demo board.
Electrical Characteristics $\left(\mathrm{V}_{\mathrm{IN}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}\right.$ unless otherwise noted. Bold values designate
-40 to $85^{\circ} \mathrm{C}$ temperature range)

| Symbol | Description | Conditions | Min | Typ | Max | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Functional Block Diagram

## Functional Description

The AAT4670 dual channel load switch, implemented with isolated independent P-channel MOSFET devices, is ideal for applications where dual power supplies are in continuous use. Typical applications for this include products with multiple USB ports, or ports requiring protection that operate off of separate power supplies. The input power supplies can be any voltage between 2.2 V and 5.5 V in any combination; one supply is not required to be the higher voltage. Internally, the power supply for the control circuitry will automatically switch to the higher of the two supplies. In the case where the supplies are equal, $+/-30 \mathrm{mV}$ of hysteresis prevents the internal supply from oscillating between the two input supplies. The low impedance P-channel MOSFET devices are identical in size allowing for layout flexibility. They are controlled by a patented fast acting current loop, and respond to short circuits in a fraction of a microsecond, which eases requirements on the input capacitors. With such fast transient response time, the upstream power supply rail is naturally isolated from the protected port. The AAT4670 is internally protected from thermal damage by an over temperature detection circuit. If a high ambient temperature or an
over current condition causes the die temperature to reach the internal thermal limit, both power devices are switched off until the die temperature cools to a level below the thermal limit threshold. The device will thermal cycle indefinitely until the over current or high temperature condition is removed. Due to the high thermal conductivity of silicon and the size of the die, the temperature across the die is relatively uniform at high temperatures, and therefore, as a precaution, both power devices are switched off when the thermal threshold is reached. Since the power devices operate off of independent power supplies, independent under voltage lockout circuits are employed. If the power supply to one channel falls below the under voltage lockout threshold, the other channel will remain active. A current limit condition is reported by the open drain FAULT output associated with the appropriate channel. A thermal limit condition is reported by both FAULT outputs. A three millisecond blanking interval prevents false reporting during the charging of a capacitive load, which typically occurs during device turn-on, but may also occur during a port hot plug-in event.

The AAT4670 is ideally suited for protection of peripheral ports such as USB, PS2 and parallel ports.

## Applications Information

## Input Capacitor

The input capacitors, $\mathrm{C}_{\operatorname{INA}}$ and $\mathrm{C}_{\text {INB }}$, protect the input power supplies from current transients generated by loads attached to the AAT4670. If a short circuit is suddenly applied to an output of the AAT4670, there is a 750 nanosecond period during which a large current flows before current limit circuitry activates. (See characteristic curve "Short Circuit Through $0.3 \Omega$. .") In this event, a properly sized input capacitor can dramatically reduce the voltage transient seen by the power supply and other circuitry upstream from the AAT4670. $\mathrm{C}_{\mathrm{IN}}$ should be located as close to the device $\mathrm{V}_{\text {IN }}$ pin as practically possible. Ceramic, tantalum or aluminum electrolytic capacitors may be selected for $\mathrm{C}_{\mathrm{IN}}$. There is no specific capacitor ESR requirement for $\mathrm{C}_{\mathbb{I N}}$. However, for higher current operation, ceramic capacitors are recommended for $\mathrm{C}_{\mathbb{I N}}$ due to their inherent capability over tantalum capacitors to withstand input current surges from low impedance sources such as batteries in portable devices.

## Output Capacitor

In order to insure stability while the current limit is active, a small capacitance of approximately $1 \mu \mathrm{~F}$ is required on each output. No matter how big the output capacitor, output current is limited to the value set by the AAT4670 current limiting circuitry, allowing very large output capacitors to be used. For example, USB ports are specified to have at least $120 \mu \mathrm{~F}$ of capacitance down stream from their controlling power switch. The current limiting circuit will allow an output capacitance of $1000 \mu \mathrm{~F}$ or more without disturbing the upstream power supply.

## Attaching Loads

Capacitive loads attached to the AAT4670 will charge at a rate no greater than the current limit setting.

## FAULT Output

FAULT flags are provided to alert the system if an AAT4670 load is not receiving sufficient voltage to operate properly. If current limit or over temperature circuits in any combination are active for more than approximately three milliseconds, the associated FAULT flag is pulled to ground through approximately $100 \Omega$. Removal of voltage or current transients of less than three milliseconds prevents capacitive loads connected to either

AAT4670 output from activating the associated FAULT flag when they are initially attached. Pull up resistances of $1 \mathrm{k} \Omega$ to $100 \mathrm{k} \Omega$ are recommended. Since FAULT is an open drain terminal, it may be pulled up to any unrelated voltage less than the maximum operating voltage of 5.5 V , allowing for level shifting between circuits.

## Thermal Considerations

Since the AAT4670 has internal current limit and over temperature protection, junction temperature is rarely a concern. However, if the application requires large currents in a hot environment, it is possible that temperature rather than current limit will be the dominant regulating condition. In these applications, the maximum current available without risk of an over temperature condition must be calculated. The maximum internal temperature while current limit is not active can be calculated using Equation 1.

$$
T_{J(\text { MAX })}=I_{M A X}{ }^{2} \times R_{D S(O N)}(M A X) \times R_{\theta J A}+T_{A}(M A X)
$$

In Equation 1, $I_{\text {MAX }}$ is the maximum current required by the load. $R_{D S(O N)}(M A X)$ is the maximum rated $\mathrm{R}_{\mathrm{DS}(\mathrm{ON})}$ of the AAT4670 at high temperature. $R_{\theta A A}$ is the thermal resistance between the AAT4670 die and the board onto which it is mounted. $T_{A}(M A X)$ is the maximum temperature that the PCB under the AAT4670 would be if the AAT4670 were not dissipating power. Equation 1 can be rearranged to solve for $\mathrm{I}_{\mathrm{MAX}}$; Equation 2.

$$
I_{\mathrm{MAX}}=\sqrt{\frac{T_{\mathrm{SD}}(\mathrm{MIN})-\mathrm{T}_{\mathrm{A}}(\mathrm{MAX})}{\mathrm{R}_{\mathrm{DS}(\mathrm{ON})}(\mathrm{MAX}) \times \mathrm{R}_{\text {BJA }}}}
$$

$\mathrm{T}_{\text {SD }}(\mathrm{MIN})$ is the minimum temperature required to activate the AAT4670 over temperature protection. With typical specification of $125^{\circ} \mathrm{C}, 115^{\circ} \mathrm{C}$ is a safe minimum value to use.
For example, if an application is specified to operate in $50^{\circ} \mathrm{C}$ environments, the PCB operates at temperatures as high as $85^{\circ} \mathrm{C}$. The application is sealed and its PCB is small, causing $R_{\theta \mathrm{\theta A}}$ to be approximately $120^{\circ} \mathrm{C} / \mathrm{W}$. Using Equation 2,

$$
I_{\max }=\sqrt{\frac{115-85}{160 \mathrm{~m} \times 120}}=1.25 \mathrm{~A}
$$

To prevent thermal limiting, the operating load current in the application must be less than 1.25A which lies in the current limiting range, so in this application, any operating current below the current limit threshold is allowed.
