FRED, Rectifier Diode and Thyristor Chips in Planar Design	5

### IGBT Chips

	$V_{CES}$	$I_C$	
<b>G-Series, Low <math>V_{CE(sat)}</math> B2 Types</b>	600 ... 1200 V	7 ... 20 A	6
<b>G-Series, Fast C2 Types</b>	600 V	7 ... 20 A	6
<b>S-Series, SCSOA Capability, Fast Types</b>	600 V	10 ... 20 A	6
<b>E-Series, Improved NPT<sup>3</sup> technology</b>	1200 ... 1700 V	20 ... 150 A	7

### MOSFET Chips

	$V_{DSS}$	$R_{DS(on)}$	
<b>HiPerFET™ Power MOSFET</b>	70 ... 1200 V	0.005 ... 4.5 $\Omega$	8-10
<b>PolarHT™ MOSFET, very Low <math>R_{DS(on)}</math></b>	55 ... 300 V	0.015 ... 0.135 $\Omega$	11
<b>P-Channel Power MOSFET</b>	-100 ... -600 V	0.06 ... 1.2 $\Omega$	12
<b>N-Channel Depletion Mode MOSFET</b>	500 ... 1000 V	30 ... 110 $\Omega$	12
<b>Layouts</b>			13-17

### Bipolar Chips

	$V_{RRM} / V_{DRM}$	$I_{F(AV)M} / I_{T(AV)M}$	
<b>Rectifier Diodes</b>	1200 ... 1800 V	12 ... 416 A	18-19
<b>FREDs</b>	600 ... 1200 V	8 ... 244 A	20-21
<b>Low Leakage FREDs</b>	200 ... 1200 V	9 ... 148 A	22-23
<b>SONIC-FRD™ Diodes</b>	600 ... 1800 V	12 ... 150 A	24-25
<b>GaAs Schottky Diodes</b>	100 ... 600 V	3.5 ... 25 A	26-27
<b>Schottky Diodes</b>	8 ... 200 V	28 ... 145 A	28-31
<b>Phase Control Thyristors</b>	800 ... 2200 V	15 ... 540 A	32-33
<b>Fast Rectifier Diodes</b>	1600 ... 1800 V	10 ... 26 A	34

### Direct Copper Bonded (DCB), Direct Alu Bonded (DAB) Ceramic Substrates

What is DCB/DAB?	35
DCB Specification	36

## Symbols and Definitions

$C_{ies}$	Input capacitance of IGBT
$C_{iss}$	Input capacitance of MOSFET
$-di/dt$	Rate of decrease of forward current
$I_C$	DC collector current
$I_D$	Drain current
$I_F$	Forward current of diode
$I_{F(AV)M}$	Maximum average forward current at specified $T_h$
$I_{FSM}$	Peak one cycle surge forward current
$I_{GT}$	Gate trigger current
$I_R$	Reverse current
$I_{RM}$	Maximum peak recovery current
$I_T$	Forward current of thyristor
$I_{T(AV)M}$	Maximum average on-state current of a thyristor at specified $T_h$
$I_{TSM}$	Maximum surge current of a thyristor
$R_{DS(on)}$	Static drain-source on-state resistance
$R_{thjc}$	Thermal resistance junction to case
$r_T$	Slope resistance of a thyristor or diode (for power loss calculations)
$T_{case}$	Case temperature
$T_h$	Heatsink temperature
$t_{fi}$	Current fall time with inductive load
$T_j, T_{(vj)}$	Junction temperature
$T_{jm}, T_{(vj)m}$	Maximum junction temperature
$t_{tr}$	Reverse recovery time of a diode
$V_{CE(sat)}$	Collector-emitter saturation voltage
$V_{CES}$	Maximum collector-emitter voltage
$V_{DRM}$	Maximum repetitive forward blocking voltage of thyristor
$V_{DSS}$	Drain-source break-down voltage
$V_F$	Forward voltage of diode
$V_R$	Reverse voltage
$V_{RRM}$	Maximum peak reverse voltage of thyristor or diode
$V_T$	On-state voltage of thyristor
$V_{TO}$	Threshold voltage of thyristors or diodes (for power loss calculation only)

## Nomenclature

### IGBT and MOSFET Discrete

<b>IXSD 40N60A</b>	<b>(Example)</b>
<b>IX</b>	IXYS
	<b>Die technology</b>
<b>E</b>	NPT <sup>3</sup> IGBT
<b>F</b>	HiPerFETTM Power MOSFET
<b>G</b>	Fast IGBT
<b>S</b>	IGBT with SCSSOA capability
<b>T</b>	Standard Power MOSFET
<b>D</b>	Unassembled chip (die)
<b>40</b>	Current rating, 40 = 40 A
<b>N</b>	N-channel type
<b>P</b>	P-channel type
<b>60</b>	Voltage class, 60 = 600 V
<b>xx</b>	
	<b>MOSFET</b>
<b>A</b>	Prime RDS(on) for standard MOSFET
<b>Q</b>	Low gate charge die
<b>Q2</b>	Low gate charge die, 2nd generation
<b>P</b>	PolarHTTM Power MOSFET
<b>L</b>	Linear Mode MOSFET
	<b>IGBT</b>
<b>--</b>	No letter, low VCE(sat)
<b>A</b>	Or A2, std speed type
<b>B</b>	Or B2, high speed type
<b>C</b>	Or C2, very high speed type

### Diode and Thyristor Chips

<b>C-DWEP 69-12</b>	<b>(Diode Example)</b>
<b>C</b>	Package type
<b>D</b>	Chip function D = Silicon rectifier diode
<b>W</b>	Unassembled chip
<b>EP</b>	Process designator EP = Epitaxial rectifier diode N = Rectifier diode, cathode on top P = Rectifier diode, anode on top FN = Fast Rectifier diode, cathode on top FP = Fast Rectifier diode, anode on top
<b>69</b>	Current rating value of one chip in A
<b>-12</b>	Voltage class, 12 = 1200 V
<b>W-CWP 55-12/18</b>	<b>(Thyristor Example)</b>
<b>W</b>	Package type
<b>C</b>	Chip function C = Silicon phase control thyristor
<b>W</b>	Unassembled chip
<b>P</b>	Process designator P = Planar passivated chip cathode on top
<b>55</b>	Current rating value of one chip in A
<b>12/18</b>	Voltage class, 12/18 = 1200 up to 1800 V

## General Informations for Chips

When mounting Power Semiconductor chips to a header, ceramic substrate or hybrid thick film circuit, the solder system and the chip attach process are very important to the reliability and performance of the final product. This brochure provides several guidelines that describe recommended chip attachment pro-cedures. These methods have been used successfully for many years at IXYS.

### Available forms of chip packings

IXYS offers various options.

Please order from one of the following possibilities:

Packaging Options	Delivery form
C-...*	Chips in tray (Waffle Pack); Electrically tested
T-...*	Chips in wafer, unsawed; Bipolar = 5" (125 mmØ) wafer; Electrically tested, rejects are inked
W-...*	Chips in wafer on foil, sawed; Bipolar = 5" (125 mmØ) wafer; Electrically tested, rejects are inked

...\* must be amended by the exact chip type designation.

### Packing, Storage and Handling

Chips should be transported in their original containers. All chip transfer to other containers or for assembly should be done only with rubber-tipped vacuum pencils. Contact with human skin (or with a tool that has been touched by hand) leaves an oily residue that may adversely impact subsequent chip attach or reliability.

At temperatures below 104°F (40°C), there is no limitation on storage time for chips in sealed original packages. Chips removed from original packages should be assembled immediately. The wetting ability of the contact metallization with solder can be preserved by storage in a clean and dry nitrogen atmosphere.

The IGBT and MOSFET Chips are electrostatic discharge (ESD) sensitive. Normal ESD precautions for handling must be observed. Prior to chip attach, all testing and handling of the chips must be done at ESD safe work stations according to DIN IEC 47(CO) 701. Ionized air blowers are recommended for added ESD protection.

Contamination of the chips degrades the assembly results. Finger prints, dust or oily deposits on the surface of the chips have to be absolutely avoided.

Rough mechanical treatment can cause damage to the chip.

### Electrical Tests

The electrical properties listed in the data sheet presume correctly assembled chips. Testing of **non**-assembled chips requires the following precautions:

- High currents have to be supplied homogeneously to the whole metallized contact area.
- Kelvin probes must be used to test voltages at high currents
- Applying the full specified blocking or reverse voltage may cause arcing across the glass passivated junction termination, because the electrical field on top of the passivation glass causes ionization of the surrounding air. This phenomenon can be avoided by using inert fluids or by increasing the pressure of the gas surrounding the chip to values above 30 psig (2 bars).

### General Rules for Assembly

The linear thermal expansion coefficient of silicon is very small compared to usual contact metals. If a large area metallized silicon chip is directly soldered to a metal like copper, enormous shear stress is caused by temperature changes (e.g. when cooling down from the solder temperature or by heating during working conditions) which can disrupt the solder mountdown.

If it is found that larger chips are cracking during mountdown or in the application, then the use of a low thermal expansion coefficient buffer layer, e.g. tungsten, molybdenum or Trimetal®, for strain relief should be considered. An alternative solution is to soft-solder these larger chips to DCB ceramic substrates because of their matching thermal expansion coefficients.

## Assembly Instructions

### MOS/IGBT Chips

#### Recommended Solder System

IXYS recommends a soft solder chip attach using a solder composition of 92.5 % Pb, 5 % Sn and 2.5 % Ag. The maximum chip attach temperature is 460°C for MOSFET and 360°C for HiPerFET™ and IGBT.

#### Wire Bonding

It is recommended to use wire of diameter not greater than 0.38 mm (0.015") for bonding to the source emitter and gate pads. Multiple wires should be used in place of thicker wire to handle high drain or emitter currents. See tables for number of recommended wire bonds. At smaller gate pads 0.15 mm is recommended.

#### Thermal Response Testing

To assure good chip attach processing, thermal response testing per MIL STD 750, Method 3161 or equivalent should be performed.

### Bipolar Chips

#### Assembling

IXYS bipolar semiconductor chips have a soft-solderable, multi-layer metallization (Ti/Ni/Ag) on the bottom side and, on top, either the same metallization scheme or an aluminium layer sufficiently thick for ultrasonic bonding. Note that the last layer of metal for soldering is pure silver.

Regardless of their type all chips possess the same glass passivated junction termination system on top of the chip. For that reason they can be easily chip bonded or they can all be simply soldered to a flat contacting electrode in accordance to the General Rules on Page 3. All kinds of the usual soft solders with melting points below 660°F (350°C) can be used thanks to their pure silver top metal. Solders with high melting points are preferable due to their better power cycling capability, i.e. they are more resistant to thermal fatigue.

Soldering temperature should not exceed 750°F (400°C). The maximum temperature should not be applied for more than five minutes.

As already mentioned above the electrical properties quoted in the data sheets can only be obtained with properly assembled chips. This is only possible when all contact materials to be soldered together are well wetted and the solder is practically free of voids.

A simple means to achieve good solder connections is to use a belt furnace running with a process gas containing at least 10 % Hydrogen in Nitrogen.

Other approved methods are also allowed, provided that the above mentioned temperature-time-limits are not exceeded and temperature shocks above 930°F/min (500 K/min) are avoided.

We do not recommend the use of fluxes for soldering!

#### Ultrasonic Wire Bonding

Chips provided with a thick aluminium layer are designed for ultrasonic wire bonding. Wire diameters up to 500 µm can be used dependent on chip types. Setting wires in parallel and application of stitch bonding lead to surge current ratings comparable to soldered chips.

#### Coating

Although the chips are glass passivated, they must be protected against arcing and environmental influences. The coating material that is in contact with the chip surface must have the following properties:

- elasticity (to prevent mechanical stress)
- high purity, no contamination with alkali metals
- good adhesion to metals and glass passivation.

# FRED, Rectifier Diode and Thyristor Chips in Planar Design

## Fast Recovery Epitaxial Diodes (FRED)

Power switches (IGBT, MOSFET, BJT, GTO) for applications in electronics are only as good as their associated free-wheeling diodes. At increasing switching frequencies, the proper functioning and efficiency of the power switch, aside from conduction losses, is determined by the turn-off behavior of the diode (characterized by  $Q_{rr}$ ,  $I_{RM}$  and  $t_{rr}$  - Fig. 1).

The reverse current characteristic following the peak reverse current  $I_{RM}$  is another very important property. The slope of the decaying reverse current  $di_r/dt$  results from design parameters (technology and diffusion of the FRED chip Fig. 2). In a circuit this current slope, in conjunction with parasitic inductances (e.g. connecting leads, causes over-voltage spikes and high frequency interference voltages. The higher the  $di_r/dt$  ("hard recovery" or "snap-off" behavior) the higher is the resulting additional stress for both the diode and the paralleled switch. A slow decay of the reverse current ("soft recovery" behavior), is the most desirable characteristic, and this is designed into all FRED. The wide range of available blocking voltages makes it possible to apply these FRED as output rectifiers in switch-mode power supplies (SMPS) as well as protective and free-wheeling diodes for power switches in inverters and welding power supplies.

Fig. 1: Current and voltage during turn-on and turn-off switching of fast diodes

## Rectifier Diode and Thyristor Chips

The figures 3 a-c show cross sectional views of the diode and thyristor chips in the passivation area. All thyristor and diode chips (DWN, DWFN, CWP) are fabricated using separation diffusion processes so that all junctions terminate on the topside of the chip. Now the entire bottom surfaces of all chips are available for soldering onto a DCB or other ceramic substrate without a molybdenum strain buffer. The elimination of the strain buffer and its solder joint reduces thermal resistance and increases blocking voltage stability. The junction termination areas are passivated with glass, whose thermal expansion coefficient matches that of silicon. All silicon chips increasingly use planar technology with guard rings and channel stoppers to reduce electric fields on the chip surface. The contact areas of the chips have vapor deposited metal layers which contribute substantially to their high power cycle capability. All chips are processed on silicon wafers of 5" diameter and diced after a wafer sample test which auto-matically marks chips not meeting the electrical specification. The chip geometry is square or rectangular.
